\*THE ANALYSIS AND CONCLUSIONS SET FORTH ARE THOSE OF THE AUTHORS AND DO NOT INDICATE CONCURRENCE BY OTHER MEMBERS OF THEIR RESPECTIVE RESEARCH STAFFS, THE BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM, THE BUREAU OF ECONOMIC ANALYSIS, OR THE DEPARTMENT OF COMMERCE. DATA IN THIS PUBLICATION ARE ESTIMATES BASED ON INCOMPLETE SOURCE MATERIAL AND ARE NOT OFFICIAL FIGURES OF THE U.S. GOVERNMENT OR THE FEDERAL RESERVE SYSTEM.

## I. INTRODUCTION

1. This paper reports on an ongoing effort at the Federal Reserve Board (FRB) and the Bureau of Economic Analysis (BEA) to integrate the nation's macroeconomic accounts. BEA publishes the national income and product accounts (NIPA) and international transaction accounts (ITA). The NIPA conveys production and income flows in the United States—the current accounts. The NIPA also includes data on the accumulation and value of tangible assets. The presentation in the NIPA is heaviest on national aggregates, with a mixture of sector and transaction detail. The ITA records the nation's transactions and balances with the rest of the world. It provides detail on the U.S. external position and changes in that position, in many cases by region and country.
2. The FRB publishes the flow of funds accounts (FFA). The focus of the presentation is on sector activity. For each sector, the FFA combines a capital account (showing saving and capital expenditures) and a financial account (showing net acquisition of financial assets and net incurrence of liabilities). The FFA includes detail on flows of financial instruments and stocks of financial assets and liabilities. For certain private sectors, the FFA has balance sheets, which combine information on tangible assets with stocks of financial assets and liabilities. The FFA offers considerable detail for specific financial instruments, such as mortgages, corporate bonds, and deposits.
3. The three published accounts—NIPA, ITA, and FFA—are major elements of a full set of integrated national accounts outlined in standards developed by a consortium of international agencies and published as the System of National Accounts 1993 (SNA93).<sup>1</sup> The U.S. supplied considerable leadership toward the development and adoption of the international standards; in large part, because the existing set of accounts in the U.S. are well developed and are used extensively for policy and economic analysis. The U.S. accounts provide a long history of macroeconomic activity, using a consistent methodology, and with a level of detail and quality rarely matched in accounts of other countries. The publications are available quarterly and are produced in a timely fashion.

---

<sup>1</sup> SYSTEM OF NATIONAL ACCOUNTS 1993, prepared under the auspices of the Inter-Secretariat Working Group on National Accounts, Commission of the European Communities-Eurostat, International Monetary Fund, Organization for Economic Co-operation and Development, United Nations, and World Bank (1993).

4. Over the past decade, many changes to the U.S. accounts have moved them closer to SNA93 standards. For example, in the NIPA comprehensive revision that was released in December 2003, the tables and definition of transactions were changed to make them much more consistent with SNA93.<sup>2</sup> Nonetheless, the agencies and the user public have recognized that the accounts could be more fully integrated.<sup>3</sup> Closer coordination between the agencies would ensure that certain critical elements—such as sector boundaries, alternative data sources, and treatment of transactions—are handled in a way that minimizes distortions of important analytical concepts. Integration likely would align U. S. statistics more closely with those of other nations, and allow policymakers and researchers to analyze more fully and accurately the interrelationships of the nation's financial and nonfinancial activities. Integration of the accounts also would provide a common terminology and a uniform presentation that highlighted connections between the activities described in separate accounts.
5. The U.S. effort toward a better or more fully integrated set of economic accounts has a long history. Particularly noteworthy was a stab at such accounts undertaken by Richard Ruggles and Nancy Ruggles about a quarter century ago.<sup>4</sup> While retaining much of the existing account structure, they showed a framework for all economic statistics that embraced both stocks and flows using the then existing NIPA, ITA, and FFA. The commentary on their effort highlighted significant conceptual issues and considerable disagreement on the form of such accounts. Some of those issues and disagreements remain; but over the years, international consensuses, published in SNA93, have eliminated many.
6. Given the consensus, our work focuses on the actual production of accounts. With regard to the Ruggleses 1982 paper, James Tobin noted that “their experiment ... illustrate[d] the well-known problem. It is difficult to reconcile data from the different sources, and disturbingly large, unexplained discrepancies

remain...Conceptual integration needs to be matched by a concerted effort to diagnose and remedy these inconsistencies.”<sup>5</sup>

7. Diagnosing and remedying inconsistencies has been our goal. Indeed, preparing this paper, including the attached tables, is perhaps the most significant joint effort on the accounts since the Tobin comment was made. The agencies have looked closely at sector boundaries and the nature of discrepancies that arise from using different data sources, judgmental adjustments, and estimating techniques. We have uncovered many issues and have solved a few; others remain for future work.
8. We have also considered ways to present the vast amount of data that lie within integrated accounts. As matters stand, the FFA quarterly release is more than a hundred pages and the number of tables in the NIPA and ITA could easily fill an equal number of pages. Even if done parsimoniously and coherently, a combined set of accounts likely will require considerable navigation by the user.
9. Other countries and economic areas are in various stages of providing a fully integrated set of macroeconomic accounts. Canada, for example, has published integrated accounts for some time. The integration extends to benchmarking to the input-output accounts. Moreover, within Statistics Canada, there is coordination so that common estimation methods are used among the accounts; and, where issues arise, implications are considered for the full range of accounts, rather than a single portion.
10. Eurostat provides a coordinating role within Europe. They have published standards in the European System of Accounts (ESA95) patterned on SNA93. EU member countries are legally required to meet the standards for national income and product accounts and financial accounts over a set time schedule. They are requested to transmit regularly annual financial and non-financial accounts to Eurostat. The European Central Bank is coordinating development of quarterly financial accounts for the euro area, and, thus far, countries have provided quarterly national data, which are used, together with other euro area financial statistics, to compile a subset of quarterly Monetary Union financial accounts for nonfinancial sectors, insurance companies, and pension funds. They are working toward expanding the integrated system to seven sectors—households, nonfinancial corporations, government, monetary financial institutions, insurance corporations and pension funds, other financial intermediaries, and the rest of the world.

---

<sup>5</sup> Ibid, 74.

11. International agencies are also providing impetus to the efforts. The IMF guides and manuals for national statistics are increasingly ensuring that accounting and other elements are consistent with SNA93 standards. Moreover, international agencies have sponsored ongoing committees and conferences during which issues pertaining to SNA93 standards are addressed. Currently, an effort is underway to update SNA93. The OECD is coordinating dissemination of integrated accounts among member countries.
12. The next section of this paper offers an overview of the contents of an integrated set of accounts and reviews how those accounts are related to current publications in the U.S. Section 3 discusses draft SNA-USA sector tables produced with the recent data in the NIPA, ITA, and FFA. Section 4 highlights several issues that affect the quality of the accounts, mainly those dealing with the statistical discrepancies between the capital and financial accounts. Section 5 has a few concluding comments.

## **II. WHAT ARE INTEGRATED ACCOUNTS AND WHERE DO WE STAND WITH CURRENT PUBLICATIONS?**

13. The SNA93 structure envisions separate statements for sectors of the economy. Each statement would show accounts for production, income, saving, investment, and financial flows for that sector. Those sector flow accounts are combined with information on changes in value of assets and liabilities due to factors not related directly to production and saving. All together, the integrated accounts offer a means to track the sources of change in sectors' net worth; the SNA93 structure begins with a balance sheet position and fully explains how that position evolves. Along the way, it provides detail on transactions, the distribution of income by factors of production, financial intermediation, and other aspects of national and sector economic activity.
14. The types of accounts are listed in text table 1, along with comments on how each account relates to what is currently published. The first, the current account, is comprised of production and income sub accounts that provide the familiar measures for gross domestic product (GDP), national income, and their components.
15. Although there are nearly 300 NIPA tables that provide extensive detail on the flows underlying the major aggregates, there are still some gaps relative to what would be needed for a complete set of integrated accounts. In addition to what is currently in the NIPA, the integrated accounts envision providing such information by

major sectors and subsectors. In the production account, SNA93 recommends a presentation of gross output, intermediate consumption, and value added by each sector. BEA provides this type information *by industry* in its input-output and GDP-by-industry accounts, and provides value-added information *by sector* in tables 1.3.5 and 1.14. However, the NIPA tables do not provide information on gross output or intermediate consumption for the major sectors. The more familiar presentation of GDP in NIPA table 1.1.5, though, presents it as the sum of final expenditures (a calculation that SNA93 presents only in the input-output or “supply-use” tables). The SNA93 distribution and use of income accounts are similar to the NIPA private enterprise income, personal income and outlay, government receipts and expenditures, and foreign transactions accounts, but would show more detail on financial and nonfinancial corporations and noncorporate business. Published integrated accounts may retain the information shown on these or similar tables, but they would also clearly derive the saving for each sector and for the total economy.

16. The most important shortcoming of the NIPA relative to the integrated accounts envisions by SNA93 is an inconsistency in sector definitions between the production account and the distribution and use of income account. While SNA93 calls for using consistently defined sectors throughout, the sectors emphasized in the NIPA production account differ from those presented in the distribution and use of income accounts. The NIPA production account, as shown in table 1.3.5, presents three major domestic sectors—business (including private and government noncorporate business), general government, and households and institutions. In contrast, the distribution and use of income accounts feature a personal sector (which includes income derived from private noncorporate business), a government account (which includes government business enterprises—that is, the full public sector), and, implicitly, a corporate business sector, which is defined by corporate legal form of organization (presented in table 1.14). Some production information is presented for corporate business, but these estimates are based on the income approach, and, therefore, differ from the expenditure-approach estimates for the other production account sectors. Consequently, the statistical discrepancy between these two types of estimates prevents the derivation of an estimate of value-added for the noncorporate business sector as the difference between value-added for corporate business and for the full business sector. Developing estimates for a consistent set of sectors is a major objective of this paper.

17. A second set of accounts is accumulation accounts. Much of the information for the capital account, the first accumulation account, is provided in the current NIPA. Data for capital outlays and saving are compiled by major sectors. Although not currently labeled as such, FFA sector statements typically begin with a capital account. However, the terminologies in the NIPA and FFA are not consistent with each other, among the sectors, or with that in SNA93.
18. Financial accounts, the mainstay of the FFA, are available in considerable detail. The FFA tables offer information for more than thirty sectors, many of which are financial intermediaries. Data for about fifty instruments are published in the FFA, with a separate set of tables describing the issuers and purchasers of each instrument. Again, the terminology in the tables differs from international norms and the organization of the tables varies slightly among sectors.
19. SNA93 structure has additional accumulation accounts for revaluations of stocks and changes in volume of stocks due to neither revaluation nor net purchases. The information in the U.S for revaluation accounts and other changes in volume accounts is less developed than that for other types of flows. The FFA reconciliation tables enumerate factors that lead to changes in net worth. They estimate holding gains and losses for equity, real estate, and other instruments and other factors that change the level of assets and liabilities. The ITA also provides figures in some tables on revaluations due to currency and price changes of assets and liabilities.
20. The SNA format envisions balance sheet positions for each sector. The FFA publishes balance sheet tables for three sectors—the household and nonprofit organizations sector and the two nonfinancial business sectors. For other sectors in the FFA, balance sheet data are limited to financial assets and liabilities. The necessary information for tangible assets of private subsectors has not been fully developed; and, of course, there are many issues concerning valuation of tangible assets of governments other than reproducible assets.
21. The listing in table 1 implies most of the elements of integrated accounts are in currently published material, although the missing pieces are critical in many instances. Moreover, data for some elements are incomplete or thin. Sophisticated users of the NIPA, ITA, and FFA likely are aware that this is the case, but because the information is diffused over different publications, there is a perception by a new or occasional user that the accounts are unrelated. Use of the combined accounts is cumbersome, at best. For anyone analyzing international transactions for example,

the differences between the FFA rest of world sector and BEA's international transactions tables seem enormous. In fact, they are not, as both agencies rely on the same information, but present it differently. Less well known are the inconsistencies between accounts that remain in the published data and the dangers of drawing analytical conclusions from a combination of the accounts.

### **III. DRAFT SNA-USA TABLES**

22. This section presents draft SNA-USA tables, an integration of the agencies accounts. We were able to construct virtually all the series required from existing data in the NIPA, ITA, and FFA. In those instances where information was incomplete, we made estimates. We are reasonably confident that the figures in the tables are near what would be derived from a more sustained effort, but they remain unofficial estimates from the agencies.
23. Each sector table is lengthy, and the accounts are quite a bit to absorb in a single sitting, even though we have limited them to the major sectors. Little attempt was made at this stage to whittle down the information to ease the presentation, because a goal is to understand and show the structure of the accounts. We maintained the traditional time series format, with tables that have annual figures for 1995 to 2002. The estimates are based on data available in early 2004.<sup>6</sup>
24. In draft SNA-USA, the economy is divided into five sectors—households and nonprofit institutions serving households, nonfinancial business, financial business, government, and the rest of the world (table 2). Draft SNA-USA tables show subsectors for nonfinancial corporate business, nonfinancial noncorporate business, federal government and state and local governments.

---

<sup>6</sup> March 4, 2004 marked the release of the FFA for 2003:Q4. Preliminary estimates of the NIPA for that period were published on February 27, 2004. International transaction accounts for 2003:Q4 were made available on March 12, 2004, and are not reflected in the data.

<b>TABLE 1: STRUCTURE OF INTEGRATED MACROECONOMIC ACCOUNTS</b>				
<b>ACCOUNT</b>	<b>SUB ACCOUNTS</b>	<b>WHAT IT SHOWS</b>	<b>WHAT IS PUBLISHED NOW</b>	<b>SIGNIFICANT ISSUES</b>
Current	Production	Gross value added and consumption of fixed capital by sector. For the economy as a whole, sum is Gross (Net) Domestic Product	National aggregates in the NIPA with some sector detail.	Gross output and intermediate consumption not available by sector. No production accounts for subsectors.
	Distribution and use of income, including saving	Generation of income within sectors and payment to factors of production supplied by other sectors. Shows taxes and transfers. Use of income provides a derivation of saving as difference between disposable income and consumption.	National aggregates in NIPA with some sector detail.	Accounts for some financial subsectors not provided.
Accumulation	Capital	Capital outlays for structures, equipment, and software, net lending/or net borrowing of funds.	National aggregates in NIPA with some sector detail. Additional detail provided by BEA for FFA. Truncated account shown for all sectors.	Detail for all sectors is not provided.
	Financial	How net lending/net borrowing was satisfied through increase in financial assets and incurrence of liabilities.	Sector and instrument detail in the FFA and ITA.	Sector boundaries in FFA may not match those in NIPA; some differences between rest of world sector in FFA and ITA.
	Other changes in volume	Changes in net worth that arise from factors unrelated to revaluation and net saving, such as bad debts, accounting changes, data discontinuities.	Some sector and instrument detail in FFA and ITA.	Not provided for all sectors. More limited than the revaluation account.
	Revaluation	Nominal changes in net worth arising from holding gains/losses. Splits gains/losses into real and relative price changes	Some sector and instrument detail in FFA and ITA.	Not provided for all sectors. In FFA, limited to equity shares and real estate.
Balance sheet	Opening position	Beginning period value of assets, liabilities, and net worth.	Published for some sectors in the FFA.	Not provided for all sectors.
	Changes in stock positions	Summary of changes in net worth due to (a) capital formation, (b) net lending/borrowing, (c) revaluation of assets and liabilities, and (d) other changes in volume.	Published for some sectors in the FFA, but not in the form envisioned in the SNA.	A change in format might be helpful, using international terminology.
	Closing position	Ending period value of assets, liabilities, and net worth.	Published for some sectors in the FFA.	Not provided for all sectors.

25. There are several differences between draft SNA-USA sectors and those in SNA93 and current publications.
- The household sector includes nonprofit institutions serving households (NPISH). Over the past decade, both agencies developed and published separate sets of estimates for NPISHs, but their definitions of the sector boundary differ enough at this time that combining separately estimated financial and nonfinancial flows was not possible. In addition, assets of bank personal trusts are part of assets of the household sector; in the FFA, such trusts are a separate financial sector, with the level and change in the total value of the sector assets a separate instrument held by households.
  - The division of the nonfinancial business sector in draft SNA-USA into corporate and unincorporated sectors closely matches current publications.<sup>7</sup> The unincorporated sector includes both partnerships and sole proprietors, the latter of which would be within the household sector boundary in SNA93, while the former would be merged with corporations.<sup>8</sup>
  - Draft SNA-USA treatment of housing, specifically owner-occupied and tenant-occupied housing, differs in some respects from SNA93 guidance, but is the same as in the NIPA and FFA. Owner-occupied housing production and finances are in the household sector, and the transactions associated with such activity are treated as business-type transactions within the sector. Rental housing transactions are also of a business type, but they are part of the nonfinancial noncorporate business sector in

---

<sup>7</sup> SNA93, and international statistical terminology generally, defines *corporation* more broadly than in the U.S. In the international terminology, a corporation sector refers to institutional business enterprises grouped together because of the type of function they perform while, in the U.S., a corporation sector refers to a legal form of business. Except in instances where the meaning should be clear or where the statistical consequences are judged insignificant, draft SNA-USA has retained the terminology in the NIPA and FFA, using business to refer to type of sector and corporation to refer to a specific legal form of business.

<sup>8</sup> SNA93 defines *quasi-corporations* as unincorporated enterprises operated as if they were separate corporations whose de facto relationship to their owner is that of a corporation to its shareholders. It specifically notes one form of quasi-corporation is an unincorporated enterprise, including an unincorporated partnership, owned by households, which is operated as if it were a privately owned corporation. Quasi-corporations are not limited to those owned by households, however; they may include government business enterprises and partnerships.

TABLE 2: SECTORS IN DRAFT SNA-USA		
SECTOR	SUBSECTORS	COMMENTS
1. Households and nonprofit institutions serving households	None	Work is underway at both agencies to create a subsector for nonprofit institutions serving households with data published in both the NIPA and FFA. Current efforts seek to coordinate the NIPA and FFA information for consistency in sector boundary and data sources.
2. Nonfinancial business	Nonfinancial corporate business	In SNA93, the unincorporated business sector is divided into units that are not separable from households that own them (for example, most sole proprietorships), which is included in the household sector, and units that are distinct and maintain separate accounts (for example, partnerships), which are included in the nonfinancial corporate business sector. At present, available source data do not permit this treatment in the U.S., nor is it clear that the SNA93 treatment is most useful for analysis, although agencies may consider this treatment, if additional source data are developed.
	Nonfinancial noncorporate business (partnerships and sole proprietorships)	
3. Financial business	None	Financial businesses in the U.S. represent a diverse set of institutions that carry out intermediation of funds. Additional subsectors and detail on their types of transactions are provided in the FFA. Data for revaluations, other changes in volume (such as for loan write-offs), and value of tangible assets need to be developed.
4. General government	Federal government, including federal government enterprises	Developing information for the market value of tangible assets remains problematic, particularly land or the combination of land and structures. Monuments, parks, and other public facilities present difficult valuation issues.
	State and local governments, including regional government enterprises	
5. Rest of world	None	SNA measures an increase in purchases of national securities by foreigners as an increase in rest of world assets. In the balance of payments, such flows are a positive capital inflow to the nation. The draft SNA-USA provides an integration of foreign activity with other sectors.

draft SNA-USA. As suggested above, SNA93 would include activities of individuals that provide rental homes in the household sector.

- Draft SNA-USA, SNA93, and NIPA differ in their placement of government enterprises, such as the Postal Service and Tennessee Valley Authority. In draft SNA-USA and the FFA, their activity is within the government sector. In the NIPA, there is a mixed treatment of government business enterprises; their activities are presented as part of the business sector in the production account; but, for calculating net saving, they are consolidated with the government sector in the government receipts and expenditures account.

26. In addition, as indicated in the comments in table 2, portions of the other changes in volume, revaluation, and balance sheet accounts are unavailable or underdeveloped for some sectors. In particular, balance sheet accounts for the government sectors and financial business sector reflect only the reproducible portion of tangible assets. Thus, buildings are included, but the full market value of real estate is not.

27. The following narrative introduces significant elements of draft SNA-USA. It also highlights differences from currently published series. After some brief comment about the total economy current account, the discussion turns to the sectors, with more detailed comments for the household sector to explain the terminology and structure common to all the tables.

#### *TOTAL ECONOMY—CURRENT ACCOUNT (TABLE 1)*

28. Draft SNA-USA table 1 shows the current account for the economy as a whole, and illustrates that the account reflects an *income-side* approach. We have used SNA93 terminology—GDP/gross value added on line 1, and net domestic product (line 3), while in the NIPA we refer to these figures as gross (net) domestic income. That is, in the NIPA, there are two methods of calculating GDP. The featured measure, known as GDP, is based on the sum of final expenditures (personal consumption, private investment, net exports, and government consumption and investment). The other measure, known as gross domestic income, is based on the sum of incomes generated from production. Because these measures, which are conceptually identical, are estimated from separate source data, they differ by a statistical discrepancy. For this paper we avoid dealing with the effects of this

discrepancy by focusing on the income-side measure, or gross domestic income; the more familiar expenditure-side measure is line 42.<sup>9</sup>

29. The specific income factors are shown on lines 4 through 8. One term, *operating surplus* (line 8), is a concept that only recently has appeared in U.S. accounts. In SNA93, it is defined as “the surplus accruing from processes of production before deducting any explicit or implicit interest charges, rents, or other property incomes payable on the financial assets, land, or other tangible nonproduced assets required to carry on the production.”<sup>10</sup> In other words, it is a broad income concept that includes interest, rent, and profits.
30. The middle section of the current account describes net national income (line 9), which differs from net domestic product by inclusion of income receipts from and payments to the rest of world. Net saving for the total economy (line 39) is derived by subtracting final consumption expenditures (line 38) from disposable income (line 37). Relative to the NIPA, the net saving in draft SNA-USA differs by wage accruals less disbursements (line 44).

*HOUSEHOLDS AND NONPROFIT ORGANIZATIONS SERVING HOUSEHOLDS SECTOR (TABLE 3)*

31. Production in the household sector (line 1) and net domestic product (line 3) are measured largely by compensation paid (line 4) and net operating surplus in draft SNA-USA (line 8). In the context of the household sector, the operating surplus is that part of GDP associated with owner-occupied housing. It also includes net interest on fixed assets used by NPISHs. In both cases, the operating surplus is net of taxes on production and imports less subsidies (line 7).
32. While output of the sector is relatively small, it receives the bulk of net national income (line 9) in the form of employee compensation (line 11) and property income (line 14), including “withdrawals from income of quasi-corporations (line 18),” which is the sum of proprietors’ income and rental income of tenant-occupied housing in the NIPA.
33. In draft SNA-USA, household sector disposable income (line 26) is slightly different than “personal disposable income” in the NIPA. In draft SNA-USA, interest

<sup>9</sup> Total gross value added NIPA table 1.3.5 (Gross Value Added by Sector) is similar but not identical to the draft SNA-USA gross value added. The NIPA table subsumes the statistical discrepancy and puts value added of government enterprises in the business sector; draft SNA-USA has not allocated the discrepancy, and government enterprises are in the government sector.

<sup>10</sup> SNA93 ¶ 7.82

received (line 15) and interest paid (line 19) are part of the derivation of net national income for the sector. In addition, current transfers paid (line 25) are subtracted from net national income. In the NIPA, disposable personal income includes interest paid and other current transfers paid.

34. Nonetheless, net saving (line 28) in draft SNA-USA is the same as personal saving in the NIPA, because it is calculated as disposable income (line 26) less sector consumption expenditures (line 27), instead of the more comprehensive personal outlays concept in the NIPA. When calculating the household sector saving rate, the smaller denominator in draft SNA-USA results in a slightly higher level for the rate (Chart 1, panel 1).
35. The capital account for the household sector is straightforward. Net saving is reduced by capital transfers received (net) (line 31). For this sector, such transfers are estate and gift taxes paid to the government and net migrants' transfers received by the rest of the world.
36. Importantly, net capital formation (line 32) excludes consumer durable goods purchases, which are a component of consumption expenditures (line 27). The accounting treatment of consumer durable goods outlays in the current and capital account is consistent with SNA93 (and NIPA). However, because we chose to show the value of the stock of consumer durable goods as household sector assets, this treatment has implications for the revaluation and balance sheet accounts.
37. The difference between saving and capital formation is net lending or borrowing (line 37), the amount the sector supplies to financial markets for other sectors or requires from the financial markets to meet its own needs. The figures in SNA.3 indicate the household sector has been a net borrower since 1996.
38. The details of how the sector meets its borrowing requirement is revealed in the financial account, where accounting identities require net lending/borrowing to equal the net acquisition of financial assets (line 39) less the net incurrence of liabilities (line 68). The "net" in the financial account refers to purchases less sales of assets, and the extensions less repayment of liabilities.
39. Although conceptually the same, the value of household sector net lending/net borrowing derived in the financial account (line 80) differs substantially from that in the capital account. Indeed, it is less clear from the figures on line 80 whether the sector has consistently borrowed over the past six years.

40. The difference between the net lending/net borrowing derived in the capital account and that derived in the financial account is defined in draft SNA-USA as the sector's statistical discrepancy (line 79). The treatment of the statistical discrepancy is problematic and has implications for the estimates of household sector net worth.
41. Some nations do not show a discrepancy between the two measures of net lending/borrowing. Rather, they force equality in some way, such as splitting the difference between the financial account and the current and capital accounts. (There is no recognition of such discrepancies in SNA93.) Our practice is to report the discrepancy. An indication, albeit a crude indication, of the success of our efforts to bring the accounts into better alignment will be the reduction of the statistical discrepancies between the financial account and the current and capital accounts for sectors.<sup>11</sup> We take a closer look at the different values of net lending/borrowing in the next section.
42. The remaining accumulation accounts provide additional information on how estimates of net worth of the sector are affected in the period. An account for "other changes in volume" allows for recording factors that are not defined as financial transactions or holding gains and losses in the period. The revaluation account lists changes in value of assets due to holding gains and losses.
43. We used the other changes in volume account to insert net investment in consumer durable goods (line 82). Our view, not shared in SNA93, is that the value of such goods is an important household sector asset that belongs with other tangible assets on the balance sheet account. BEA estimates the value of the stock consistent with the expenditures in the current account, including depreciation and revaluations. The FRB uses the data to complete estimates of tangible assets in the FFA sector balance sheet statement. Draft SNA-USA retains that balance sheet treatment.
44. The revaluation account (lines 84 to 94) records nominal holding gains and losses for nonfinancial assets and financial assets. We have carried over the practice of estimating the gains for real estate (combined land and structures), because the agencies have found no acceptable way, on a macro-sector basis, of

---

<sup>11</sup> In the household sector, the sum of net lending/net borrowing in the financial account and net capital formation is an alternative, but conceptually equivalent, measure of saving from the FFA.

separating changes in the value of land from the changes in the value of structures on the land.<sup>12</sup>

45. The change in net worth for the household sector is shown on line 95 at the beginning of the balance sheet account. It is the sum of net capital formation, net lending/borrowing, other changes in volume, and nominal holding gains/losses. Importantly, the net lending/borrowing figure used for calculation of net worth is that from the capital account, rather than the financial account. This differs from the currently published figures in the FFA, where net worth is incremented by net lending/borrowing in the financial account. Put another way, in draft SNA-USA, we chose to rely on net saving in the NIPA rather than the equivalent measure in the FFA. Even so, the change in net worth, in draft SNA-USA is not much different for each year than the figures currently published (Chart 1, panel 2).
46. End of period stocks in the household balance sheet are similar to those currently published in the FFA, with two exceptions. First, the terminology for asset and liability items is consistent with international terminology, which should allow for easier comparison across countries. Instruments have been grouped as recommended in SNA93. This was also done in the financial account in draft SNA-USA. Second, the level of net worth reflects the accumulated value of the statistical discrepancy between the capital account and the financial account, which was entered as an asset category (line 130).
47. Draft SNA-USA household sector net worth (relative to disposable income) is compared to the published estimates on panel 3 of Chart 1. Again, the differences do not appear significant.<sup>13</sup>

#### *NONFINANCIAL NONCORPORATE BUSINESS SECTOR (TABLE 4)*

48. As noted above, the noncorporate business sector includes partnerships and sole proprietorships (including tenant-occupied housing). Draft SNA-USA has a full set of accounts for this sector.

---

<sup>12</sup> No attempt was made to separate nominal holding gains into neutral gains (those due to changes in the general price level) and real gains (those due to changes in the relative prices of assets), as SNA93 would dictate.

<sup>13</sup> Had the data been taken back further, the result would be similar—the time series properties are the same; a simple analysis that used net worth in draft SNA-USA showed no significant difference from a typical model of aggregate consumption spending that used the net worth currently published.

49. Income generated in the sector is paid out to the household sector as withdrawals from income of quasi-corporations (line 14).<sup>14</sup> As a result, the sector has no net saving. Nonetheless, there is capital formation and financial transactions in the noncorporate business sector. The additions to net worth (line 72) result mainly from capital gains on real estate shown in the revaluation account (line 64).<sup>15</sup>

*NONFINANCIAL CORPORATE BUSINESS SECTOR (Table 5)*

50. We have been able to provide a full set of accounts for the nonfinancial corporate business sector. The sector's value added (line 1) is more than half of total output of the economy. Consumption of fixed capital (line 2) in this sector, as with other sectors, is on an economic basis, reflecting the capital consumption adjustment to book (tax) depreciation. Similarly, in the capital account, inventory investment (line 33) reflects the NIPA valuation adjustment so that inventories are at current prices and on a consistent accounting basis.
51. The draft SNA-USA current account arguably offers a more comprehensive and intuitive view of flows through the sector, although the terminology is probably unfamiliar to users of NIPA tables. Measures of profits and cash flow are noticeably missing from our presentation. Given their importance for analytical work in the U.S., providing them likely would be a welcome addition to future versions.
52. The sector has no final consumption expenditures, and the SNA format shows disposable income (line 23) as net saving (line 24); net saving in this sector and the financial business sector is the same as undistributed corporate profits in the NIPA. Again, the presentation lacks a measure of total internal funds that is used to derive the financing gap shown in the FFA—a sometimes-helpful measure of the impetus for corporate borrowing. Net lending and borrowing (line 34) is nearly the same concept, but it includes undistributed profits of foreign subsidiaries which are not in the FFA calculation.
53. The statistical discrepancy resulting from the difference in net lending/borrowing in the capital account and in the financial account was handled the same way as it was for the household sector. Net saving in the capital account was used to derive

---

<sup>14</sup> Households withdraw income from both financial and nonfinancial quasi-corporations.

<sup>15</sup> We considered a number of ways to treat household equity in noncorporate business, and, although the method chosen is consistent within the sequence of accounts, it is not necessarily consistent with SNA93 and is under review.

changes in net worth (line 90), and the accumulated discrepancy is an asset in the balance sheet account (line 122).

54. The calculation and interpretation of net worth in the nonfinancial corporate business sector (line 142) is substantially different from that currently published. In the FFA, net worth is the market (or replacement) value of assets less liabilities, *excluding equity capital*. That measure of net worth is sometimes compared to the market value of shares for nonfinancial corporate businesses or to net worth derived with tangible assets at historical cost. Draft SNA-USA follows the format in SNA93, which calculates net worth as the market (or replacement) value of assets less liabilities, *including the market value of shares and other equity* (line 134).
55. While the currently published measures of nonfinancial corporate business sector net worth are large positive figures (Chart 2, panel 1), the draft SNA-USA measure has both positive and negative values (panel 2). Indeed, as would be expected from the elevated equity valuations in the late 1990s, the draft SNA-USA measure of net worth moved sharply lower from 1996 to 1999, before turning up in 2000 and becoming positive in 2002.
56. The draft SNA-USA measure of net worth may be interpreted as a variant of Tobin's Q. As defined by Tobin, Q is the ratio of the market value of the firm (equity plus debt) to the replacement cost of its tangible assets. For the nonfinancial corporate business sector, debt and equity are the bulk of liabilities in the SNA format, and they correspond to the numerator of Q. Tangible assets (the denominator in Q) are about half of total assets on the sector balance sheet.<sup>16</sup> Therefore, a negative net worth in draft SNA-USA corresponds to a Q greater than one, while a positive net worth corresponds to a Q of less than one.

*FINANCIAL BUSINESS SECTOR (TABLE 6)*

57. The financial business sector includes the monetary authority, depository institutions, insurance and pension funds, and all other financial intermediaries, such as finance companies, mutual funds, and brokers and dealers. But for a complete accounting for the value of real estate, we have been able to compile nearly a full set of accounts for the combined sector.

---

<sup>16</sup> The popular press often uses a variant of Q equal to the ratio of the market value of equity of the sector to the published net worth of the sector. The popular version differs from true Q by including financial assets and non-debt liabilities in the denominator.

58. The current account and capital account are structured the same as the nonfinancial corporate business sector, with the exception of withdrawals from quasi-corporations, and the financial account is a summation of lending and borrowing flows of all the financial intermediaries in the flow of funds accounts. For this sector, we did not net intra-sector assets and liabilities. For example, issuance of a mortgage-backed security by a government sponsored enterprise and purchased by a bank is reflected as a net incurrence of a liability (in line 52) and as an acquisition of a financial asset (in line 36).
59. A consequence of showing gross flows of the sector is that there are sizable revaluations of financial assets (line 73) and liabilities (line 77). As with other sector accounts, shares and other equity instruments were revalued for capital gains and losses. Other types of liabilities, such as bonds and mortgages were not revalued. Past research found little impact on net worth of sector balance sheets when liabilities other than equities were revalued. However, that work predated the recent down-shift in interest rates; and it was not applied to the financial business sector that is now available.
60. While draft SNA-USA shows an account for other changes in volume for financial corporations, the data are not well developed. In particular, debt write-offs are not included. Rather they are reflected in changes in the flows in the financial account. A better articulation of such information would likely make analysis of business and household financing in the economy clearer, and the draft SNA-USA format provides a focused means for eventually recording the figures as they are developed.
61. The change in net worth for the financial business sector (and for the government sectors that follow) is calculated using the same factors as for the household and nonfinancial business sectors, with an important exception. Data are available only for reproducible assets, which include structures; data are not available for the market value of real estate, which combines the value of structure and land. As a result, the change in net worth (line 84) and the level of net worth (line 133) are limited. The change excludes revaluations of real estate and the level excludes the market value of real estate, but includes the current cost value of structures.

*GOVERNMENT SECTORS (TABLES 7 AND 8)*

62. In the government sectors, current surpluses (deficits) are measured by net saving (line 24). Net lending or borrowing (line 33) in the capital account provides a

broader measure of the surplus/deficit, by taking into account investment in fixed assets; it is the measure most akin to the budget surplus/deficit reported by OMB.

63. The capital account also shows the net acquisition of *nonproduced* nonfinancial assets (line 31 on both tables). The federal government has been a seller of such assets, which include the sale of electromagnetic spectrum rights and leasing of offshore drilling rights. For state and local governments, acquisition of nonproduced assets reflects net purchases of land and access rights for roads. The counterparty for the government sales, leases, and purchases is the nonfinancial corporate business sector.
64. The revaluation and balance sheet account for the government sectors has the same limitations as the financial business sector concerning real estate values. As a result, stocks in the balance sheet are for reproducible tangible assets, financial assets, and liabilities.
65. In the past, BEA and the FRB have collaborated to compile a consolidated government sector. Both the NIPA and FFA have a consolidated sector and doing so in SNA format should be a relatively straightforward exercise for the agencies in the future.

*REST OF WORLD SECTOR (TABLE 9)*

66. The rest of world sector is a mirror image of the international transactions accounts published by BEA. In the current account, net saving, or the current external balance (line 8), is derived as the difference in foreign income received from U.S. residents and foreign outlays to U.S. residents. The capital account adds net capital transfers and subtracts acquisitions of nonproduced nonfinancial assets to derive net lending and borrowing to U.S. residents from the rest of the world. That figure must offset the sum of net lending/borrowing for domestic sectors.<sup>17</sup>
67. Data for the draft SNA-USA financial, other changes in volume, and revaluation accounts are taken from BEA's international transaction accounts and underlying source data. The nature of the presentation is the same as the domestic sectors. It

---

<sup>17</sup> Net lending from the rest of the world does in fact equal the net borrowing from the domestic sectors after accounting for the NIPA statistical discrepancy, wage accruals less disbursements, and rounding differences. The statistical discrepancy is a factor because we used data for capital formation from the NIPA product side and net saving from the NIPA income side. The figures for all the sectors are shown on table SNA.2.

differs from the ITA, however, because many financial transactions are netted in draft SNA-USA (and the FFA), while they are shown gross in the ITA.

68. The statistical discrepancy in the rest of world sector—the difference between net lending calculated in the current and capital account and net lending in the financial account reflects the statistical discrepancy in the recorded balance of payments as well as a combination of other differences in residency definitions in the NIPA, ITA, and the FFA. The agencies have a project underway to reconcile differences between the accounts.

#### **IV. ISSUES CONCERNING THE INTEGRATION OF THE ACCOUNTS**

69. As noted above, the agencies are working to minimize sector discrepancies that result from using alternative data sources and methods. Those discrepancies are summarized by the net lending/net borrowing measures compared in Chart 3. The charts indicate that the pattern of net lending/net borrowing is similar in each sector whether measured by the capital account or the financial account. Even so, there are significant differences for some sectors and in some years.

70. For the household sector (panel 1), the differences in net lending/borrowing between draft SNA-USA capital account and financial account may be closer for the period shown than for earlier periods not shown. Until about 1998, personal saving in the financial account averaged about two percentage points more than in the current account. Put another way, the financial account implies that households accumulated more assets than suggested by flows from the capital account, and household sector net worth is about six percent higher in the FFA than in draft SNA-USA. (The six percent is the value of the accumulated discrepancy shown on the balance sheet account of the household sector.)

71. The household sector discrepancy in the FFA has been the subject of several studies over the years.<sup>18</sup> The residual calculation of some categories in the current account and the residual calculation of most asset categories and some liability categories in the financial and balance sheet accounts leave considerable room for speculation on the sources of the difference. A benefit of integrating the national

---

<sup>18</sup> See for example, "Measuring Household Saving: Recent Experience from the Flow-of-Funds Perspective," John F. Wilson, James L. Freund, Frederick O. Yohn, Jr., and Walter Lederer, in *THE MEASUREMENT OF SAVING, INVESTMENT, AND WEALTH*, Robert E. Lipsey and Helen Stone Tice, editors, (Studies in Income and Wealth, Volume 52, 1989), 101-152.

accounts as we have done for this paper is that the nature of the problem is more clearly defined in terms of stocks and flows of the sector.

72. An additional concern to the agencies has been the difference in net lending/borrowing for the nonfinancial corporate business sector (panel 2). Creating draft SNA-USA pointed to several likely sources for the discrepancy. A particularly vexing one lies in the agencies separation of nonfinancial and financial businesses, a boundary that is important for analysis of disintermediation and evaluation of flows, such as interest paid and interest received. The boundary also has implications for measuring stocks and net worth in the sectors.
73. The business boundary problem reflects in part differences in source data for the NIPA and the FFA. NIPA relies heavily on tax return data, and the FFA supplements tax data with surveys and regulatory information to compile accounts for financial corporations. In the NIPA, corporations that file consolidated returns, which combine data for nonfinancial and financial subsidiaries, are either in the financial or nonfinancial business sectors, depending on the predominant business. In the financial accounts, adjustments are made with the supplementary information to split consolidated corporations into financial and nonfinancial enterprises. The issue is particularly acute in cases for firms with captive finance companies, such as General Motor's GMAC and General Electric's GE Capital.
74. Some encouragement that solving the boundary problem will reduce the discrepancy is evident on Chart 4. The net lending/net borrowing estimates of the two sectors combined aligns somewhat better than for the sectors separately.
75. In addition to the boundary problem, part of the difference between net lending/borrowing measures in the nonfinancial corporate business sector likely reflects the booking of miscellaneous financial assets. In the financial accounts, changes to goodwill and other intangible assets are included in flows of miscellaneous financial assets. Such flows are large and positive during periods of heavy merger activity; they are substantially smaller and even negative, at times, during periods of economic weakness. The impact of changes in such assets is not reflected in the current and capital accounts. SNA93 standards would relegate a portion of the changes in the value of such assets to the other changes in volume account. An effort to reclassify them into revaluations and/or other changes in volume is likely to have a sizable impact on the statistical discrepancy. No changes

were made for draft SNA-USA for the business sectors' boundary or other accounting issues.

76. Finally, net lending/borrowing estimates for the federal government sector (panel 3) are close, reflecting a generally high quality of information available. In contrast, net lending/borrowing estimates for the state and local government sector, where the data tend to be of lower quality, diverge by significant amounts. Efforts underway are likely to narrow further the discrepancy in the federal government sector. In addition, it would appear that coordination of estimation methods for missing data would more tightly integrate the accounts of the state and local government sector.

#### **IV. WHERE DO WE GO FROM HERE?**

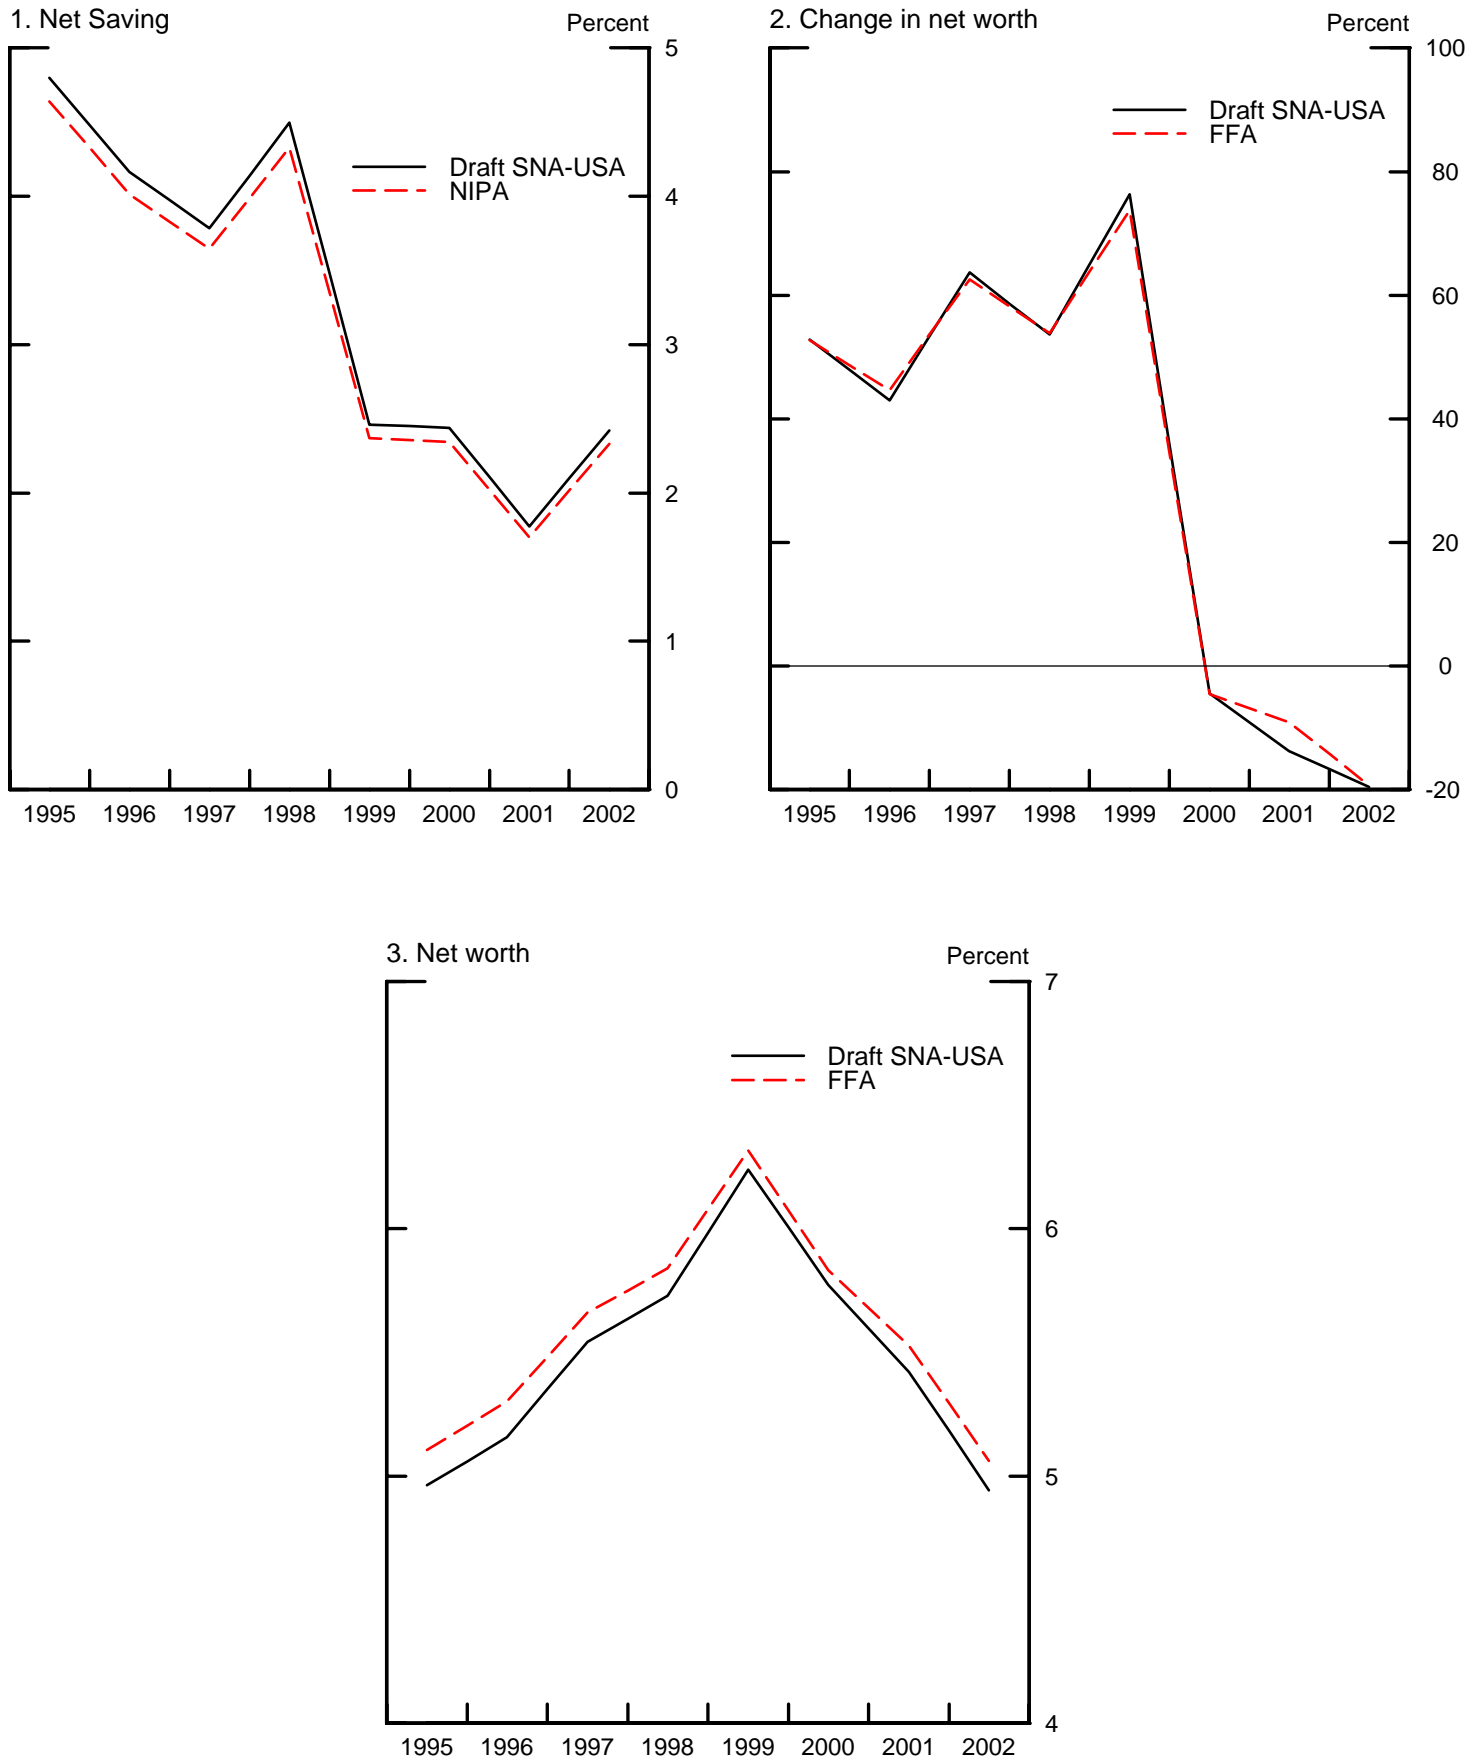

77. Aside from reformulating the structure of the accounts to international standards, it has been our intention to use the integration of the accounts to improve the quality and usefulness of the estimates published. Specific items that require joint work by the agencies have been identified, including further work on ensuring that sector boundaries are consistent across accounts, developing additional source material for sectors where information is not available, and sharing data sources and methods for estimating missing data.
78. We have shown that SNA-USA tables can be produced for the period 1995-2002. Considerable work is still required, if the agencies chose to rework the published figures into the draft SNA-USA structure for the period before 1995. The exercise indicated, moreover, that considerable investment is needed to produce the integrated accounts on a continuing basis, and even greater investment to carry out the improvements identified.
79. BEA's Strategic Plan outlines a number of research and development activities related to the development of integrated accounts. Work is already under way to examine sector definitions, with particular consideration given to the development of improved source data on government business enterprises. Other research is also being conducted on improving the consistency of source data between the NIPA and FFA, for example, to improve consistency of NIPA interest flow estimates with FFA estimates of interest-bearing assets and liabilities. Efforts are also underway to improve the estimates of fixed assets and to provide more reliable information on valuation and legal form of ownership of these assets. Finally, efforts are also

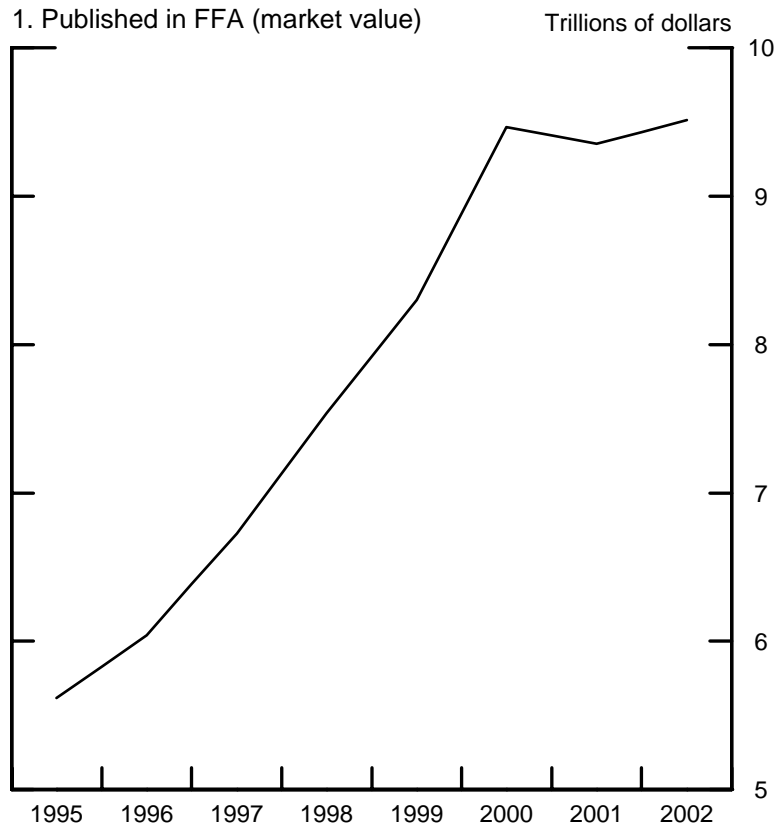

underway, as described in other papers presented at this conference, to improve integration with other BEA accounts, such as the input-output accounts, and with the BLS productivity statistics.

80. In addition to the joint staff work noted above, efforts at the Federal Reserve are directed toward improving integration in the capital accounts, including research into expanding the detail for financial sectors and adding balance sheets for selected financial subsectors. In conjunction with that work will be an effort to develop detailed information for the other changes in value accounts, including data for debt write-downs and data that would allow a reliable parsing of certain detailed items in the "miscellaneous" categories of assets and liabilities into financial flows and other volume changes.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.

(1) Includes other financial institutions, depository institutions, insurance companies and pension funds, and monetary authority.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.

\*\* Partial--Does not include revaluation of tangible assets.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.

\*\* Partial--Does not include revaluation of tangible assets.

(1) Does not include employee retirement funds.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.

\*\* Partial--Does not include revaluation of tangible assets.

\* The discrepancy is the difference between net lending or borrowing derived in the capital account and the same concept derived in the financial account. The discrepancy reflects differences in source data, timing of recorded flows, and other statistical differences between the capital and financial accounts.
