Note: The real product and productivity estimates for the national economy are subject to downward bias because of the inclusion of real government product estimates, which do not allow for productivity changes in general government.

^a For productivity comparisons, real product is weighted by the Marshall-Edgeworth formula, as described in the appendix text, so its movements differ somewhat from the estimates presented in Table A-1. This is also the case with real product indexes at the various sectoral levels, presented in subsequent tables.
