

This PDF is a selection from an out-of-print volume from the National Bureau of Economic Research

Volume Title: Residential Real Estate: Its Economic Position as Shown by Values, Rents, Family Incomes, Financing, and Construction, Together with Estimates for All Real Estate

Volume Author/Editor: David L. Wickens

Volume Publisher: NBER

Volume ISBN: 0-87014-037-X

Volume URL: <http://www.nber.org/books/wick41-1>

Publication Date: 1941

Chapter Title: Part Three: A Value of Residential Real Estate, Tables A 1â€™17

Chapter Author: David L. Wickens

Chapter URL: <http://www.nber.org/chapters/c5645>

Chapter pages in book: (p. 77 - 110)

PART THREE

SECTION A

Value of Residential Real Estate

Section A has 17 tables. The number and value of non-farm dwelling units in 1930 are covered in the first 7. Tables A 1-5 are based upon estimates prepared by the National Bureau as described in detail in Chapter II. The value estimates are based upon owners' statements of value and tenants' statements of rent. The probable accuracy of owners' appraisals is discussed in Chapter I, section 2, and the technical methods used in estimating aggregate values are presented in the Note to Part One.

The information on values in Tables A 1-5 is given for six population groups. As explained in Chapter II, section 2 a, it was not possible to make the further important breakdown by metropolitan and nonmetropolitan areas. For this reason, it should be borne in mind that average values and rents by population groups obscure variations within the groups, depending on the proportion of satellite and non-satellite cities included. Other evidence indicates that in certain areas the location of cities within or outside metropolitan districts reflects the degree of urbanization better than the grouping by size. Preliminary estimates of values and rents for several metropolitan districts and adjacent nonmetropolitan areas on a county basis showed generally much higher average values and rents within metropolitan districts. These relationships were utilized in connection with the estimates of residential construction (see Ch. V, sec. 1 a). Furthermore, values and rents in satellite cities within metropolitan districts within a given population group averaged higher than in cities of the same size group outside metropolitan districts, particularly in the case of small population groups.

Tables A 6 and 7 are based upon the special tabulation of 1930 Census data for 139 cities. The essential details concerning this tabulation are presented in Chapter II, section 4. Table A 6 gives, for owner-occupied dwellings, average value per dwelling unit, all types, by value classes for each of the 139 cities and the average values of 1-family dwellings for all value classes combined. In Table B 5 similar data are presented for monthly rents of rented dwelling units and, in addition, monthly rents of 2- and 3-or-more

family dwellings. The reasons for giving rents for the two types of multiple dwelling units but not value data by similar classifications for the owner-occupied properties are stated in Chapter II, section 3 f.

The number of dwelling units for which average values (Table A 6) and rents (Table B 5) are derived for population groups of 2,500 or more can be determined from the *Census of Population, 1930, Volume VI, Families*. Since the Census does not publish data for smaller population groups separately, Tables A 7 and B 6 were prepared to show the distribution of the number of units by value and rent groups for a sample of these small population centers.

The estimate of the value of nonfarm residential real estate for 1934 (Table A 8) was based upon the value derived for 1930 from Census data and the change in values from 1930 to 1934 as determined from other sources, as explained in Chapter II, sections 5 and 6.

Tables A 9-16, derived almost entirely from either the Federal Real Property Inventory or the Financial Survey of Urban Housing, present data for 1934 and in some instances corresponding data for 1930. Table A 17 is derived from Census reports and provides information on farm residences in 1930.

The number of dwelling units by value classes (Table A 9) for 1930 and 1934 is derived from various sources, as indicated in the source note. To make the data comparable it is necessary to restrict the coverage to 1-family dwellings, since Census values are for dwelling units and the Federal Real Property Inventory obtained values of structures. Furthermore, the Census definition of 1-family dwellings differs from that used by the Federal Real Property Inventory (see Ch. II, sec. 1). Only part of the discrepancy arising from the difference in definition can be eliminated. The Federal Real Property Inventory count of 1-family dwellings excludes row houses and 2-family side-by-side houses having a common wall (see Ch. II, sec. 1, footnote 4). Row houses are shown separately; hence it was possible to add them to the number of 1-family dwellings. But since 2-family side-by-side houses were not similarly segregated it was not pos-

sible to add them to the number of 1-family dwellings. They were, however, included in the Census count. Owing to the lack of strict comparability the decrease (101,556) in the number of 1-family owner-occupied dwellings between the two years cannot be interpreted as an actual reduction in comparable units. Table A 9 is useful chiefly in studying the relative shift in the number of dwelling units among the value classes. Table B 7, which presents similar information for rented dwellings, indicates an increase of 72,635 rented dwelling units of all types for the 61 cities covered. It is probable that the decrease in 1-family owner-occupied dwellings for the 61 cities (101,556) is partly the result of the failure to include 2-family side-by-side houses for 1934 and the shift in dwelling units from the owner-occupied to the rented class. The increase in rented dwellings is due largely to a shift in tenure, which was accentuated by the depression during those years. Tables A 9 and B 7 are included primarily to show the shifts in the relative number of dwellings in the several value or rent classes. The absolute number of units indicates merely the magnitude of the quantities distributed.

The average values per dwelling unit for 50 cities in 1934 (Table A 10) are reasonably comparable with

the Census average values for 1930 since the weighting of the Financial Survey average values for each value class by the number of dwelling units in that value class as reported by the Real Property Inventory should approximate average values on a full coverage basis. Only average values of 1-family dwellings are compared, for the reason cited in the comments on Table A 9. The difference between the average values so computed for 1934 and the average values derived directly from the Financial Survey sample is revealed when Tables A 10 and 14 are compared.

Table A 17 shows the difference in the values of nonfarm and farm dwellings. The value of an acre of farm land is included with the farm dwelling to make the physical specifications of the two classes of property more alike though the land site for the farm dwelling is usually much lower in value than the land on which city dwellings are built. The construction of the dwellings must also be considered, though it is doubtful whether this difference in materials of construction and workmanship is any greater than that between many towns and cities, especially when they are in different parts of the country. For further discussion concerning the accuracy of the data see Part One, Chapter II.

Source: Based on number and aggregate value from Tables A 1 and 2

*Based on number and aggregate value of all units, including vacant.

¹Average value of farm dwelling plus average value of one acre of land.²Average value of all farm dwellings includes value of farm managers' dwellings.

Source: Special Census tabulation of 139 cities for NBER

¹ Average values derived from sampling of complete Census data, by population group:
 100,000 or more population, and Wheeling, W.Va., every 9th family.
 50,000-100,000 " " every 7th family.
 25,000-50,000 " " 6th family.
 Under 25,000 " " 4th family.

The other 90 cities, towns, and villages listed in this table and not carrying this footnote had full coverage.

Source: 1930, special Census tabulation; 1934, Real Property Inventory, Table II. Classification of dwelling units by type not strictly comparable in the two enumerations, as explained on the half-title page to sec. A. Furthermore, there is some question as to the completeness of coverage in the Real Property Inventory. The absolute differences in number of dwelling units cannot, therefore, be stressed. The emphasis should be on the major shifts of dwelling units among the value classes, as shown by the percentage distributions.

*Metropolitan district.

¹1930 Census sample data raised to full coverage by using sampling factor (see Table A 8, footnote 1).

VALUE OF RESIDENTIAL REAL ESTATE

TABLE A 9

Owner-occupied 1-Family Dwellings, Number and Percentage Distribution by Value Groups, 61 Cities by Geographic Division, April 1, 1930 and January 1, 1934

NUMBER		PERCENTAGE DISTRIBUTION															
\$10,000 and over		All value groups		Under \$1,500		\$1,500-2,999		\$3,000-4,999		\$5,000-7,499		\$7,500-9,999		\$10,000 and over

¹Census, 1930, IV, 61.

²Bureau of the Census, special tabulation.

³Average value of farm dwelling (Census, 1930, IV, 61) plus average value of one acre of land (Census, 1930, IV, 259-65).

⁴Average value of farm operator's dwelling (total value of farm operators' dwellings, Census, IV, 225-39, divided by respective number of farm operators reporting value of dwelling, cols. 2-5 above) plus average value of one acre of land (Census, 1930, IV, 259-65).
