Social Protection versus Economic Flexibility

Is There a Trade-off?

Edited by REBECCA M. BLANK

As the United States considers major overhauls in health insurance, welfare, and labor market regulation, it is important for economists and policymakers to understand the impact of social welfare programs on employment rates. This volume explores how programs such as social security, income transfers, and child care in Western Europe, the United States, and Japan have affected labor market flexibility—the ability of workers to adjust to fast-growing segments of the economy. *NBER Comparative Labor Markets Series*

Differences and Changes in Wage Structures

Edited by RICHARD B. FREEMAN and LAWRENCE F. KATZ

In the two decades since the 1970s, wages of skilled workers in the United States rose while those of unskilled workers fell; less-educated young men in particular suffered unprecedented losses in real earnings. These twelve essays explore whether this trend is unique to the United States or is part of a general growth in inequality in advanced countries.

Small Differences That Matter

Labor Markets and Income Maintenance in Canada and the United States

Edited by DAVID CARD and RICHARD B. FREEMAN

In a revealing examination of social and labor market policies in Canada and the United States during the 1980s, these essays show that subtle differences in unemployment compensation, unionization, immigration policies, and income maintenance programs have significantly affected the levels of poverty, unemployment, and income inequality in the two countries. By adopting a more activist economic strategy, Canada saw less income inequality and poverty than did the United States. *NBER Comparative Labor Markets Series*

Training and the Private Sector

International Comparisons

Edited by LISA M. LYNCH

This volume compares new evidence on the returns to worker training in the United States, Germany, France, Britain, Japan, Norway, and the Netherlands. The authors focus on Germany's formal apprenticeship programs; the U.S. system of learning-by-doing; Japan's low employee turnover and extensive company training; and Britain's government-led and school-based training schemes.
