The Evolution of Retirement: An Economic History, 1880–1990

DORA L. COSTA

The Evolution of Retirement is the first comprehensive economic history of retirement in America. Using statistical and demographic concepts, Dora Costa explains trends in retirement data. Her examination sheds light on such important topics as rising incomes and retirement, work and disease, the job prospects of older workers, living arrangements of the elderly, the development of a retirement lifestyle, and pensions and politics.

NBER Series on Long-term Factors in Economic Development

Frontiers in the Economics of Aging

Edited by DAVID A. WISE

Frontiers in the Economics of Aging directs attention to four topics: the role of retirement accounts, such as IRAs and 401(k)s, in personal saving; the economics of health care; new advances in research methodology; and aging in relation to inequality. Some of the issues analyzed within these topics are the implications of rising personal retirement saving in recent years, how health and health insurance affect labor supply, and the effects of pensions on the distribution of wealth.

An NBER Project Report

Privatizing Social Security

Edited by MARTIN FELDSTEIN

This volume represents the most important work to date on one of the pressing policy issues of the moment: the privatization of social security. Although social security is confronting enormous fiscal pressure in the face of an aging population, there has been relatively little published on the fundamentals of essential reform through privatization. *Privatizing Social Security* fills this void by studying the methods and problems involved in shifting from the current system to one based on mandatory saving in individual accounts.
