• We have focused on the statistical / econometric issues that arise with big data

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- In the time that remains, we want to spend a little time on the *practical* issues...
 - E.g., where do you actually put a 2 TB dataset?

- We have focused on the statistical / econometric issues that arise with big data
- In the time that remains, we want to spend a little time on the *practical* issues...
 - E.g., where do you actually put a 2 TB dataset?
- Goal: Sketch some basic computing ideas relevant to working with large datasets.

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

- We have focused on the statistical / econometric issues that arise with big data
- In the time that remains, we want to spend a little time on the *practical* issues...
 - E.g., where do you actually put a 2 TB dataset?
- Goal: Sketch some basic computing ideas relevant to working with large datasets.

ション ふゆ く 山 マ チャット しょうくしゃ

• Caveat: We are all amateurs

The Good News

- Much of what we've talked about here you can do on your laptop
 - Your OS knows how to do parallel computing (multiple processors, multiple cores)

ション ふゆ アメリア メリア しょうくしゃ

- Many "big" datasets are < 5 GB
- Save the data to local disk, fire up Stata or R, and off you go...

Congressional record text (1870-2010)	≈50 GB
Congressional record pdfs (1870-2010)	≈500 GB
Nielsen scanner data (34k stores, 2004-2010)	≈5 TB
Wikipedia (2013)	≈6 TB
20% Medicare claims data (1997-2009)	≈10 TB
Facebook (2013)	≈100,000 TB
All data in the world	≈2.7 billion TB

This Talk

- We are not software engineers or computer scientists.
- But we have learned that most common problems in social sciences have analogues in these fields and there are standard solutions.
- Goal is to highlight a few of these that we think are especially valuable to researchers.
- Focus on incremental changes: one step away from common practice.

ション ふゆ く 山 マ チャット しょうくしゃ

Manual Approach

- Open spreadsheet
- Output to text files
- Open Stata
- Load data, merge files
- Compute log(chip sales)
- Run regression
- Copy results to MS Word and save

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ●

Manual Approach

- Two main problems with this approach
 - Replication: how can we be sure we'll find our way back to the exact same numbers?

• Efficiency: what happens if we change our mind about the right specification?

Semi-automated Approach

Documen Semi Automat	-		Arrange by: Folder 🔻
원 chips	₩ fig2 figures mergefiles regressions	 ✓ regressions ✓ regressions_alt ✓ regressions_alt ✓ tables 	 tv tv_potato tv_potato_submission tv_data

Problems

- Which file does what?
- In what order?

Fully Automated Approach

File: rundirectory.bat
stattransfer export_to_csv.stc
statase -b mergefiles.do
statase -b cleandata.do
statase -b regressions.do
statase -b figures.do
pdflatex tv_potato.tex

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ●

- All steps controlled by a shell script
- Order of steps unambiguous
- Easy to call commands from different packages

Make

- Framework to go from source to target
- Tracks dependencies and revisions
- Avoids rebuilding components that are up to date

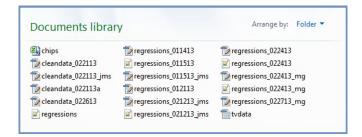

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• Used to build executable files

Version Control

(日) (월) (일) (일) (일) (일)

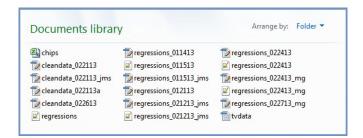

After Some Editing

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のQ@

- Dates demarcate versions, initials demarcate authors
- Why do this?
 - Facilitates comparison
 - Facilitates "undo"

What's Wrong with the Approach?

- Why not do this?
 - It's a pain: always have to remember to "tag" every new file
 - It's confusing:
 - Which log file came from regressions_022713_mg.do?
 - Which version of cleandata.do makes the data used by regressions_022413.do?
 - It fails the market test: No software firm does it this way

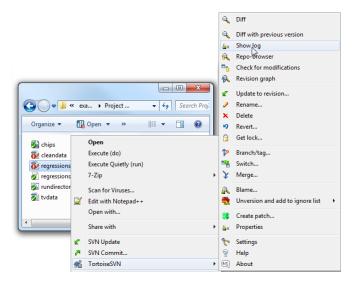

Version Control

- Software that sits "on top" of your filesystem
 - Keeps track of multiple versions of the same file
 - Records date, authorship
 - Manages conflicts
- Benefits
 - Single authoritative version of the directory
 - Edit without fear: an undo command for everything

	37003	VA	383888	7173000	4
	37004	VA	483829	7173000	3
1					

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ < ○

county	state	population			
36037	NY	3817735			
36038	NY	422999			
36039	NY	324920	state	population	region
36040	NY	143432	NY	43320903	1
37001	VA	3228290	VA	7173000	3
37002	VA	449499			
37003	VA	383888			
37004	VA	483829			

- Each variable is an attribute of an element of the table
- Each table has a key
- Tables are connected by *foreign keys* (state field in the county table)

Steps

- Store data in normalized format as above
 - Can use flat files, doesn't have to be fancy relational database software

ション ふゆ アメリア メリア しょうくしゃ

- Construct a second set of files with key transformations
 - e.g., log population
- Merge data together and run analysis

To Come

• What to do with enormous databases?

Abstraction

Parting Thoughts

◆□→ ◆御→ ◆注→ ◆注→

Code and Data

- Data are getting larger
- Research is getting more collaborative
- Need to manage code and data responsibly for collaboration and replicability

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … 釣�?

• Learn from the pros, not from us

Databases

(中) (문) (문) (문) (문)

- Database Theory
 - Principles for how to store / organize / retrieve data efficiently (normalization, indexing, optimization, etc.)
- Database Software
 - Manages storage / organization / retrieval of data (SQL, Oracle, Access, etc.)
 - Economists rarely use this software because we typically store data in flat files & interact with them using statistical programs
 - When we receive extracts from large datasets (the census, Medicare claims, etc.) someone else often interacts with the database on the back end

ション ふゆ く 山 マ チャット しょうくしゃ

Normalization

• "Database Normalization is the process of organizing the fields and tables of a relational database to minimize redundancy and dependency. Normalization usually involves dividing large tables into smaller (and less redundant) tables and defining relationships between them."

(ロ) (型) (E) (E) (E) (O)

Benefits of Normalization

- Efficient storage
- Efficient modification
- Guarantees coherence
- Makes logical structure of data clear

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Indexing

- Medicare claims data for 1997-2010 are roughly 10 TB
- These data are stored at NBER in thousands of zipped SAS files

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

Indexing

- Medicare claims data for 1997-2010 are roughly 10 TB
- These data are stored at NBER in thousands of zipped SAS files
- To extract, say, all claims for heart disease patients aged 55-65, you would need to read every line of every one of those files

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

THIS IS SLOW!!!

- The obvious solution, long understood for book, libraries, economics journals, and so forth, is to build an index
- Database software handles this automatically
 - Allows you to specify fields that will be often used for lookups, subsetting, etc. to be indexed
 - For the Medicare data, we could index age, gender, type of treatment, etc. to allow much faster extraction

ション ふゆ く 山 マ チャット しょうくしゃ

Indexing

Benefits

- Fast lookups
- Easy to police data constraints
- Costs
 - Storage
 - Time
- Database *optimization* is the art of tuning database structure and indexing for a specific set of needs

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

• Traditional databases are optimized for operational environments

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

- Bank transactions
- Airline reservations
- etc.

• Traditional databases are optimized for operational environments

ション ふゆ アメリア メリア しょうくしゃ

- Bank transactions
- Airline reservations
- etc.
- Characteristics
 - Many small reads and writes
 - Many users accessing simultaneously
 - Premium on low latency
 - Only care about current state

 In analytic / research environments, however, the requirements are different

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ の へ ()

- Frequent large reads, infrequent writes
- Relatively little simultaneous access
- Value throughput relative to latency
- May care about history as well as current state
- Need to create and re-use many custom extracts

- In analytic / research environments, however, the requirements are different
 - Frequent large reads, infrequent writes
 - Relatively little simultaneous access
 - Value throughput relative to latency
 - May care about history as well as current state
 - Need to create and re-use many custom extracts
- Database systems tuned to these requirements are commonly called "data warehouses"

Distributed Computing

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > □ Ξ

Distributed Computing

• Definition: Computation shared among many independent processors

Distributed Computing

- Definition: Computation shared among many independent processors
- Terminology
 - Distributed vs. Parallel (latter usually refers to systems with shared memory)
 - Cluster vs. Grid (latter usually more decentralized & heterogeneous)

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

On Your Local Machine

- Your OS can run multiple processors each with multiple cores
- Your video card has hundreds of cores
- Stata, R, Matlab, etc. can all exploit these resources to do parallel computing

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

On Your Local Machine

- Your OS can run multiple processors each with multiple cores
- Your video card has hundreds of cores
- Stata, R, Matlab, etc. can all exploit these resources to do parallel computing

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のへで

- Stata
 - Buy appropriate "MP" version of Stata
 - Software does the rest

On Your Local Machine

- Your OS can run multiple processors each with multiple cores
- Your video card has hundreds of cores
- Stata, R, Matlab, etc. can all exploit these resources to do parallel computing
- Stata
 - Buy appropriate "MP" version of Stata
 - Software does the rest
- R / Matlab
 - Install appropriate add-ins (*parallel* package in R, "parallel computing toolbox" in Matlab)

ション ふゆ アメリア メリア しょうくしゃ

• Include parallel commands in code (e.g., *parfor* in place of *for* in Matlab)

On Cluster / Grid

Resources abound

- University / department computing clusters
- Non-commercial scientific computing grids (e.g., XSEDE)

ション ふゆ アメリア メリア しょうくしゃ

• Commercial grids (e.g., Amazon EC2)

On Cluster / Grid

Resources abound

- University / department computing clusters
- Non-commercial scientific computing grids (e.g., XSEDE)
- Commercial grids (e.g., Amazon EC2)
- Most of these run Linux w/ distribution handled by a "batch scheduler"

ション ふゆ く 山 マ チャット しょうくしゃ

• Write code using your favorite application, then send it to scheduler with a bash script

MapReduce

- MapReduce is a programming model that facilitates distributed computing
 - Developed by Google around 2004, though ideas predate that

MapReduce

- MapReduce is a programming model that facilitates distributed computing
 - Developed by Google around 2004, though ideas predate that
- Most algorithms for distributed data processing can be represented in two steps
 - **Map**: Process individual "chunk" of data to generate an intermediate "summary"

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

• **Reduce:** Combine "summaries" from different chunks to produce a single output file

MapReduce

- MapReduce is a programming model that facilitates distributed computing
 - Developed by Google around 2004, though ideas predate that
- Most algorithms for distributed data processing can be represented in two steps
 - **Map**: Process individual "chunk" of data to generate an intermediate "summary"

- **Reduce:** Combine "summaries" from different chunks to produce a single output file
- If you structure your code this way, MapReduce software will handle all the details of distribution:
 - Partitioning data
 - Scheduling execution across nodes
 - Managing communication between machines
 - Handling errors / machine failures

MapReduce: Examples

- Count words in a large collection of documents
 - Map: Document $i \rightarrow Set of (word, count)$ pairs C_i
 - Reduce: Collapse $\{C_i\}$, summing *count* within *word*

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

MapReduce: Examples

- Count words in a large collection of documents
 - Map: Document $i \rightarrow \text{Set of } (word, count)$ pairs C_i
 - Reduce: Collapse $\{C_i\}$, summing *count* within *word*
- Extract medical claims for 65-year old males
 - Map: Record set $i \rightarrow$ Subset of *i* that are 65-year old males H_i

ション ふゆ く 山 マ チャット しょうくしゃ

• Reduce: Append elements of $\{H_i\}$

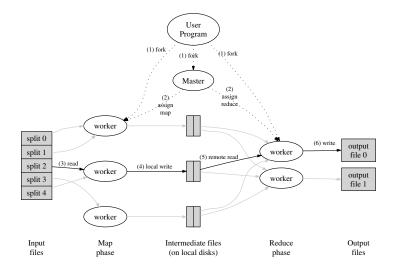

MapReduce: Examples

- Count words in a large collection of documents
 - Map: Document $i \rightarrow Set of (word, count)$ pairs C_i
 - Reduce: Collapse $\{C_i\}$, summing *count* within *word*
- Extract medical claims for 65-year old males
 - Map: Record set $i \rightarrow$ Subset of i that are 65-year old males H_i
 - Reduce: Append elements of $\{H_i\}$
- Compute marginal regression for text analysis (e.g., Gentzkow & Shapiro 2010)
 - Map: Counts x_{ij} of phrase $j \to \text{Parameters } (\hat{\alpha}_j, \hat{\beta}_j)$ from $E(x_{ij}|y_i) = \alpha_j + \beta_j x_{ij}$

ション ふゆ く 山 マ チャット しょうくしゃ

• Reduce: Append $\left\{ \hat{\alpha}_{j}, \hat{\beta}_{j} \right\}$

MapReduce: Model

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

MapReduce: Implementation

- MapReduce is the original software developed by Google
- Hadoop is the open-source version most people use (developed by Apache)

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

• Amazon has a hosted implementation (Amazon EMR)

MapReduce: Implementation

- MapReduce is the original software developed by Google
- Hadoop is the open-source version most people use (developed by Apache)
- Amazon has a hosted implementation (Amazon EMR)
- How does it work?
 - Write your code as two functions called *map* and *reduce*

ション ふゆ アメリア メリア しょうくしゃ

Send code & data to scheduler using bash script

Distributed File Systems

- Data transfer is the main bottleneck in distributed systems
- For big data, it makes sense to distribute data as well as computation
 - Data broken up into chunks, each of which lives on a separate node
 - File system keeps track of where the pieces are and allocates jobs so computation happens "close" to data whenever possible

ション ふゆ アメリア メリア しょうくしゃ

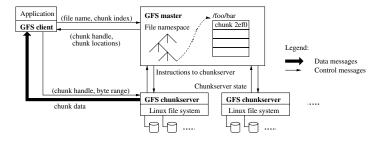

Distributed File Systems

- Data transfer is the main bottleneck in distributed systems
- For big data, it makes sense to distribute data as well as computation
 - Data broken up into chunks, each of which lives on a separate node
 - File system keeps track of where the pieces are and allocates jobs so computation happens "close" to data whenever possible

ション ふゆ アメリア メリア しょうくしゃ

- Tight coupling between MapReduce software and associated file systems
 - MapReduce \rightarrow Google File System (GFS)
 - Hadoop \rightarrow Hadoop Distributed File System (HDFS)
 - Amazon EMR \rightarrow Amazon S3

Distributed File Systems

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

Scenarios

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ ―臣 … のへで

Scenario 1: Not-So-Big Data

• My data is 100 gb or less

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

Scenario 1: Not-So-Big Data

- My data is 100 gb or less
- Advice
 - Store data locally in flat files (csv, Stata, R, etc.)
 - Organize data in normalized tables for robustness and clarity

ション ふゆ アメリア メリア しょうくしゃ

• Run code serially or (if computation is slow) in parallel

• My raw data is > 100 gb, but the extracts I actually use for analysis are << 100 gb

- My raw data is > 100 gb, but the extracts I actually use for analysis are << 100 gb
- Example
 - Medicare claims data \rightarrow analyze heart attack spending by patient by year

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

 ${\scriptstyle \bullet }$ Nielsen scanner data \rightarrow analyze average price by store by month

- My raw data is > 100 gb, but the extracts I actually use for analysis are << 100 gb
- Example
 - Medicare claims data \rightarrow analyze heart attack spending by patient by year
 - $\bullet\,$ Nielsen scanner data \rightarrow analyze average price by store by month
- Advice
 - Store data in relational database optimized to produce analysis extracts efficiently

ション ふゆ アメリア メリア しょうくしゃ

- Store extracts locally in flat files (csv, Stata, R, etc.)
- Organize extracts in normalized tables for robustness and clarity
- Run code serially or (if computation is slow) in parallel

- My raw data is > 100 gb, but the extracts I actually use for analysis are << 100 gb
- Example
 - $\bullet\,$ Medicare claims data \to analyze heart attack spending by patient by year
 - $\bullet\,$ Nielsen scanner data \rightarrow analyze average price by store by month
- Advice
 - Store data in relational database optimized to produce analysis extracts efficiently
 - Store extracts locally in flat files (csv, Stata, R, etc.)
 - Organize extracts in normalized tables for robustness and clarity
 - Run code serially or (if computation is slow) in parallel
- Note: Gains to database increase for more structured data. For completely unstructured data, you may be better off using distributed file system + map reduce to create extracts.

Scenario 3: Big Data, Big Analysis

• My data is > 100 GB and my analysis code needs to touch all of the data

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ ―臣 …の�?

Scenario 3: Big Data, Big Analysis

- My data is > 100 GB and my analysis code needs to touch all of the data
- Example
 - ullet 2 TB of SEC filing text ightarrow run variable selection using all data

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

Scenario 3: Big Data, Big Analysis

- My data is > 100 GB and my analysis code needs to touch all of the data
- Example
 - $\bullet~2~\text{TB}$ of SEC filing text \rightarrow run variable selection using all data
- Advice
 - Store data in distributed file system
 - Use MapReduce or other distributed algorithms for analysis

ション ふゆ アメリア メリア しょうくしゃ
