#### Introduction

A Quantitative Urban Framework with Traffic Congestion Model setup

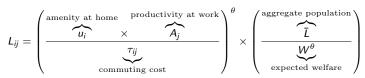

The Routing Problem Traffic and Congestion Equilibrium Implications of Traffic Congestion Counterfactuals

The welfare impacts of improving the Seattle road network

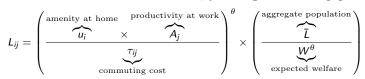

Conclusion

• City comprises  $i \in \{1, ..., N\} \equiv \mathcal{N}$  locations,  $\overline{L}$  agents.

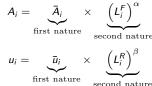

- City comprises  $i \in \{1, ..., N\} \equiv \mathcal{N}$  locations,  $\overline{L}$  agents.
- Agents choose where to live & work, yielding *commuting gravity*:

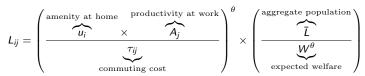

- City comprises  $i \in \{1, ..., N\} \equiv \mathcal{N}$  locations,  $\overline{L}$  agents.
- Agents choose where to live & work, yielding *commuting gravity*:

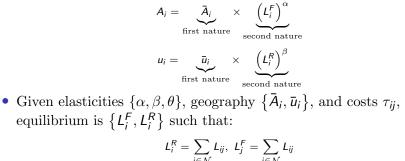

• Productivities and amenities in each location can be written as:

- City comprises  $i \in \{1, ..., N\} \equiv \mathcal{N}$  locations,  $\overline{L}$  agents.
- Agents choose where to live & work, yielding *commuting gravity*:

• Productivities and amenities in each location can be written as:

#### New component: Endogenous commuting costs

- Commuting costs  $\tau_{ij}$  are *endogenous*, depend on:
  - Agents' routing problem: What is the optimal path through the infrastructure network (taking traffic as given)?
  - Traffic congestion: How do agents' route choice, choice of where to live and work affect use of each link in the infrastructure network?

#### New component: Endogenous commuting costs

- Commuting costs  $\tau_{ij}$  are *endogenous*, depend on:
  - Agents' routing problem: What is the optimal path through the infrastructure network (taking traffic as given)?
  - Traffic congestion: How do agents' route choice, choice of where to live and work affect use of each link in the infrastructure network?
- Feedback loop: traffic congestion affects route choice & choice of where to live and work.

#### Infrastructure network

 $\bullet~N$  locations arrayed on a weighted network.

#### Infrastructure network

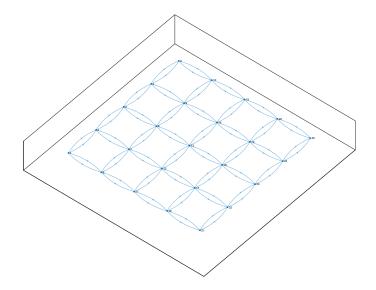

- N locations arrayed on a weighted network.
- Let  $t_{kl} \ge 1$  be the ice berg commuting cost incurred by traveling from k to l on the infrastructure network, where:

$$t_{kl} = \bar{t}_{kl} \times (\Xi_{kl})^{\lambda} \tag{1}$$

where:

- $\overline{t}_{kl} \ge 1$  is the (first nature) quality of the infrastructure connection.
- If  $\overline{t}_{kl} < \infty$ , we say that k and l are a link.
- $\Xi_{kl}$  is the traffic on link k to l.
- $\lambda$  is strength of traffic congestion ( $\lambda = 0$  in a standard model).

## Example of infrastructure network

# Outline of Talk

#### Introduction

 A Quantitative Urban Framework with Traffic Congestion Model setup
The Routing Problem
Traffic and Congestion
Equilibrium
Implications of Traffic Congestion

Counterfactuals

The welfare impacts of improving the Seattle road network

Conclusion

#### The routing choice problem

• A route from i to j of length K is a sequence of locations beginning with i and ending with j:

$$r = \{i, r_1, r_2, \dots, r_{K-1}, j\}$$

#### The routing choice problem

• A *route* from *i* to *j* of length *K* is a sequence of locations beginning with *i* and ending with *j*:

$$r = \{i, r_1, r_2, \dots, r_{K-1}, j\}$$

• Let  $\Re_{ij}$  be the set of all possible routes from *i* to *j*. Then a route  $r \in \Re_{ij}$  incurs an iceberg cost of:

$$\tau_{ij,r} = \prod_{l=1}^{K} t_{r_{l-1},r_l}$$

#### The routing choice problem

• A *route* from *i* to *j* of length *K* is a sequence of locations beginning with *i* and ending with *j*:

$$r = \{i, r_1, r_2, \dots, r_{K-1}, j\}$$

• Let  $\Re_{ij}$  be the set of all possible routes from *i* to *j*. Then a route  $r \in \Re_{ij}$  incurs an iceberg cost of:

$$\tau_{ij,r} = \prod_{l=1}^{K} t_{r_{l-1},r_l}$$

• Assume agents choose where to live, where to work, & route to maximize:

$$V_{ij,r}(\nu) = \left(A_{j}u_{i}/\prod_{l=1}^{K}t_{r_{l-1},r_{l}}\right) \times \varepsilon_{ij,r}(\nu).$$

with Frechet distributed idiosyncratic shock  $\varepsilon_{ij,r}(\nu)$ .

#### Endogenous commuting costs

• Solving the maximization problem and summing across all possible routes from *i* to *j* yields commuting gravity equation from above:

$$L_{ij} = \left(\frac{u_i \times A_j}{\tau_{ij}}\right)^{\theta} \times \left(\frac{\bar{L}}{W^{\theta}}\right)$$

where:

$$\tau_{ij} \equiv \left(\sum_{r \in \Re_{ij}} \left(\prod_{l=1}^{K} t_{r_{l-1},r_l}\right)^{-\theta}\right)^{-\frac{1}{\theta}}$$

is the *endogenous* commuting cost.

• Define the weighted adjacency matrix  $\mathbf{A} \equiv \left| \mathbf{a}_{ij} \equiv \mathbf{t}_{ij}^{-\theta} \right|$ .

• Define  $\mathbf{B} \equiv (\mathbf{I} - \mathbf{A})^{-1}$  and  $b_{ij} \equiv [\mathbf{B}]_{ij}$ .

- Define the weighted adjacency matrix  $\mathbf{A} \equiv \left| \mathbf{a}_{ij} \equiv \mathbf{t}_{ii}^{-\theta} \right|$ .
  - Define  $\mathbf{B} \equiv (\mathbf{I} \mathbf{A})^{-1}$  and  $b_{ij} \equiv [\mathbf{B}]_{ij}$ .
- If  $\rho(\mathbf{A}) < 1$  then:

$$\tau_{ij} = c b_{ij}^{-\frac{1}{\theta}} \tag{2}$$

• Mapping from infrastructure network to commuting costs (!)

- Define the weighted adjacency matrix  $\mathbf{A} \equiv \left| \mathbf{a}_{ij} \equiv \mathbf{t}_{ij}^{-\theta} \right|$ .
  - Define  $\mathbf{B} \equiv (\mathbf{I} \mathbf{A})^{-1}$  and  $b_{ij} \equiv [\mathbf{B}]_{ij}$ .
- If  $\rho(\mathbf{A}) < 1$  then:

$$\tau_{ij} = c b_{ij}^{-\frac{1}{\theta}} \tag{2}$$

- Mapping from infrastructure network to commuting costs (!)
- Notes:
  - As  $\theta \to \infty$ ,  $\tau_{ij}$  converge to commuting cost for least cost route (generalization of Dijkstra algorithm).

- Define the weighted adjacency matrix  $\mathbf{A} \equiv \left[ \mathbf{a}_{ij} \equiv \mathbf{t}_{ij}^{-\theta} \right]$ .
  - Define  $\mathbf{B} \equiv (\mathbf{I} \mathbf{A})^{-1}$  and  $b_{ij} \equiv [\mathbf{B}]_{ij}$ .
- If  $\rho(\mathbf{A}) < 1$  then:

$$\tau_{ij} = c b_{ij}^{-\frac{1}{\theta}} \tag{2}$$

- Mapping from infrastructure network to commuting costs (!)
- Notes:
  - As  $\theta \to \infty$ ,  $\tau_{ij}$  converge to commuting cost for least cost route (generalization of Dijkstra algorithm).
  - Analogy to path integral formulation of quantum mechanics: "space of all possible paths of the system in between the initial and final states, including those that are absurd by classical standards"

# Outline of Talk

#### Introduction

#### A Quantitative Urban Framework with Traffic Congestion

Model setup The Routing Problem **Traffic and Congestion** Equilibrium Implications of Traffic Congestion Counterfactuals

The welfare impacts of improving the Seattle road network

Conclusion

### From routing to traffic

• Equation (2) yields the commuting cost taking traffic congestion as given. But what is the equilibrium traffic?

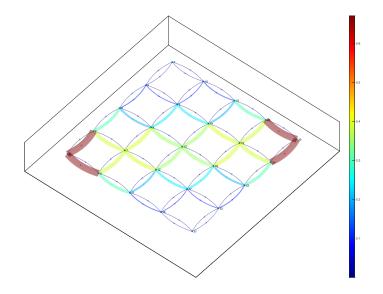

#### From routing to traffic

- Equation (2) yields the commuting cost taking traffic congestion as given. But what is the equilibrium traffic?
- First step: calculate the intensity with which a particular link is used on the way from *i* to *j*:

$$\pi_{ij}^{kl} = \left(\frac{\tau_{ij}}{\tau_{ik} \times t_{kl} \times \tau_{lj}}\right)^{\theta}$$

• Intuition: More out of the way links are used less.

Link intensity: traveling from i = 1 to j = 25

#### From routing to traffic

- Equation (2) yields the commuting cost taking traffic congestion as given. But what is the equilibrium traffic?
- First step: calculate the intensity with which a particular link is used on the way from *i* to *j*:

$$\pi_{ij}^{kl} = \left(\frac{\tau_{ij}}{\tau_{ik} \times t_{kl} \times \tau_{lj}}\right)^{\theta}$$

- Intuition: More out of the way links are used less.
- Second step: Sum over all origins and destinations to get traffic:

$$\Xi_{kl} = \sum_{i,j\in\mathcal{N}} L_{ij} \pi_{ij}^{kl}$$

#### A gravity equation for traffic

• Standard commuting gravity equation:

$$L_{ij} = \tau_{ij}^{-\theta} \times \frac{L_i^R}{RMA_i} \times \frac{L_j^F}{FMA_j} \times \frac{\bar{L}}{W^{\theta}},$$

where

• Residential market access:  $RMA_i = \sum_j \tau_{ij}^{-\theta} \times \frac{L_i^F}{FMA_i}$ 

• Firm market access: 
$$FMA_j = \sum_i \tau_{ij}^{-\theta} \times \frac{L_i^{\kappa}}{RMA_i}$$
.

#### A gravity equation for traffic

• Standard commuting gravity equation:

$$L_{ij} = \tau_{ij}^{-\theta} \times \frac{L_i^R}{RMA_i} \times \frac{L_j^F}{FMA_j} \times \frac{\bar{L}}{W^{\theta}},$$

where

- Residential market access:  $RMA_i = \sum_j \tau_{ij}^{-\theta} \times \frac{L_i^c}{FMA_i}$
- Firm market access:  $FMA_j = \sum_i \tau_{ij}^{-\theta} \times \frac{L_i^R}{RMA_i}$ .
- New traffic gravity equation:

$$\Xi_{kl} = t_{kl}^{-\theta} \times FMA_k \times RMA_l \times \frac{\bar{L}}{W^{\theta}}$$
(3)

• Intuition: Greater  $FMA_k$ , more traffic flowing in. Greater  $RMA_l$ , more traffic flowing out.

#### Introduction

#### A Quantitative Urban Framework with Traffic Congestion

Model setup The Routing Problem Traffic and Congestion **Equilibrium** Implications of Traffic Congestio Counterfactuals

The welfare impacts of improving the Seattle road network

Conclusion

• To summarize:

- To summarize:
  - Traffic gravity equation (3) shows how market access affects equilibrium traffic flows...

- To summarize:
  - Traffic gravity equation (3) shows how market access affects equilibrium traffic flows...
  - ... Through congestion (equation 1), traffic flows affects travel costs, which through routing choice (equation 2) affects commuting costs...

- To summarize:
  - Traffic gravity equation (3) shows how market access affects equilibrium traffic flows...
  - ... Through congestion (equation 1), traffic flows affects travel costs, which through routing choice (equation 2) affects commuting costs...
  - ... And commuting costs affect market access through (standard) equilibrium channels.

- To summarize:
  - Traffic gravity equation (3) shows how market access affects equilibrium traffic flows...
  - ... Through congestion (equation 1), traffic flows affects travel costs, which through routing choice (equation 2) affects commuting costs...
  - ... And commuting costs affect market access through (standard) equilibrium channels.
- A massive fixed point problem!

- To summarize:
  - Traffic gravity equation (3) shows how market access affects equilibrium traffic flows...
  - ... Through congestion (equation 1), traffic flows affects travel costs, which through routing choice (equation 2) affects commuting costs...
  - ... And commuting costs affect market access through (standard) equilibrium channels.
- A massive fixed point problem!
  - ...but it turns out to not be too bad at all.

## Equilibrium

• Eqm. conditions  $L_i^R = \sum_j L_{ij}, L_i^F = \sum_j L_{ji}$  in a standard model are:

$$\begin{pmatrix} l_i^R \end{pmatrix}^{1-\theta\beta} = \chi \sum_j \tau_{ij}^{-\theta} \bar{u}_i^{\theta} \bar{A}_j^{\theta} \begin{pmatrix} l_j^F \end{pmatrix}^{\theta\alpha} \\ \begin{pmatrix} l_i^F \end{pmatrix}^{1-\theta\alpha} = \chi \sum_j \tau_{ji}^{-\theta} \bar{u}_j^{\theta} \bar{A}_i^{\theta} \begin{pmatrix} l_j^R \end{pmatrix}^{\theta\beta}$$

### Equilibrium

• Eqm. conditions  $L_i^R = \sum_j L_{ij}, L_i^F = \sum_j L_{ji}$  in a standard model are:

$$\begin{pmatrix} l_i^R \end{pmatrix}^{1-\theta\beta} = \chi \sum_j \tau_{ij}^{-\theta} \bar{u}_i^{\theta} \bar{A}_j^{\theta} \begin{pmatrix} l_j^F \end{pmatrix}^{\theta\alpha} \\ \begin{pmatrix} l_i^F \end{pmatrix}^{1-\theta\alpha} = \chi \sum_j \tau_{ji}^{-\theta} \bar{u}_j^{\theta} \bar{A}_i^{\theta} \begin{pmatrix} l_j^R \end{pmatrix}^{\theta\beta}$$

• With traffic congestion, they become:

$$\begin{pmatrix} l_i^R \end{pmatrix}^{1-\theta\beta} \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{\theta\lambda(1-\alpha\theta)}{1+\theta\lambda}} = \chi \bar{A}_i^\theta \bar{u}_i^\theta \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{\theta(\alpha+\lambda)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ij} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{u}_i^\theta \bar{u}_j^{-\frac{\theta}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{1-\beta\theta}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^F \end{pmatrix}^{1-\theta\alpha} = \chi \bar{A}_i^\theta \bar{u}_i^\theta \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ji} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^{-\frac{\theta}{1+\theta\lambda}} \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{1-\alpha\theta}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^F \end{pmatrix}^{1-\theta\alpha} = \chi \bar{A}_i^\theta \bar{u}_i^\theta \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ji} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^{-\frac{\theta}{1+\theta\lambda}} \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{1-\alpha\theta}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ji} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^{-\frac{\theta}{1+\theta\lambda}} \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{1-\alpha\theta}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ji} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\theta)}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\theta)}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\theta)}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\theta)}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta\lambda}} \bar{A}_j^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta\lambda}} \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda}{1+\theta$$

where  $\chi \equiv \frac{\bar{L}^{\alpha+\beta}}{W}, \ I_i^R \equiv L_i^R/\bar{L}$  and  $I_i^F \equiv L_i^F/\bar{L}$  are labor shares.

## Equilibrium

• Eqm. conditions  $L_i^R = \sum_j L_{ij}, L_i^F = \sum_j L_{ji}$  in a standard model are:

$$\begin{pmatrix} l_i^R \end{pmatrix}^{1-\theta\beta} = \chi \sum_j \tau_{jj}^{-\theta} \bar{u}_i^{\theta} \bar{A}_j^{\theta} \begin{pmatrix} l_j^F \end{pmatrix}^{\theta\alpha} \\ \begin{pmatrix} l_i^F \end{pmatrix}^{1-\theta\alpha} = \chi \sum_j \tau_{ji}^{-\theta} \bar{u}_j^{\theta} \bar{A}_i^{\theta} \begin{pmatrix} l_j^R \end{pmatrix}^{\theta\beta}$$

• With traffic congestion, they become:

$$\begin{pmatrix} l_i^R \end{pmatrix}^{1-\theta\beta} \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{\theta\lambda(1-\alpha\theta)}{1+\theta\lambda}} = \chi \bar{A}_i^\theta \bar{u}_i^\theta \begin{pmatrix} l_i^F \end{pmatrix}^{\frac{\theta(\alpha+\lambda)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{ij} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{u}_i^\theta \bar{u}_j^{-\frac{\theta}{1+\theta\lambda}} \left( l_i^R \right)^{\frac{1-\beta\theta}{1+\theta\lambda}} \\ \begin{pmatrix} l_i^R \end{pmatrix}^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \left( l_i^F \right)^{1-\theta\alpha} = \chi \bar{A}_i^\theta \bar{u}_i^\theta \left( l_i^R \right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \chi \frac{\theta\lambda}{1+\theta\lambda} \sum_j \left( \bar{\mathfrak{t}}_{jj} \bar{L}^\lambda \right)^{-\frac{\theta}{1+\theta\lambda}} \bar{A}_i^\theta u_i^\theta \frac{\theta\lambda}{1+\theta\lambda} \bar{A}_j^{-\frac{\theta}{1+\theta\lambda}} \left( l_i^F \right)^{\frac{1-\alpha\theta}{1+\theta\lambda}}$$

where  $\chi \equiv \frac{\bar{L}^{\alpha+\beta}}{W}$ ,  $I_i^R \equiv L_i^R/\bar{L}$  and  $I_i^F \equiv L_i^F/\bar{L}$  are labor shares.

$$\begin{pmatrix} \hat{l}_i^R \end{pmatrix}^{1-\theta\beta} = \hat{\chi} \sum_j \begin{pmatrix} \underline{L}_{ij} \\ \underline{L}_i^R \end{pmatrix} \hat{\tau}_{ij}^{-\theta} \begin{pmatrix} \hat{l}_j^F \end{pmatrix}^{\theta\alpha} \\ \begin{pmatrix} \hat{l}_i^F \end{pmatrix}^{1-\theta\alpha} = \hat{\chi} \sum_j \begin{pmatrix} \underline{L}_{ji} \\ \underline{L}_i^F \end{pmatrix} \hat{\tau}_{ji}^{-\theta} \begin{pmatrix} \hat{l}_j^R \end{pmatrix}^{\theta\beta}$$

• With traffic congestion:

$$\left(\hat{l_i^R}\right)^{-\theta\beta+1} \left(\hat{l_i^F}\right)^{\frac{\theta\lambda(1-\alpha\theta)}{1+\theta\lambda}} = \hat{\chi}\left(\frac{L_i^F}{L_i^F + \sum_j \Xi_{ij}}\right) \left(\hat{l_i^F}\right)^{\frac{\theta(\alpha+\lambda)}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta\lambda}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^R}\right)^{\frac{1-\beta\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ij}}{L_i^F + \sum_j \Xi_{ij}}\right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left(\hat{l_i^F}\right)^{\frac{\theta}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta}{1+\theta\lambda}} +$$

$$\left( \widehat{l_i^R} \right)^{\frac{\theta \lambda (1 - \beta \theta)}{1 + \theta \lambda}} \left( \widehat{l_i^F} \right)^{-\theta \alpha + 1} = \widehat{\chi} \left( \frac{L_i^R}{L_i^R + \sum_j \Xi_{ji}} \right) \left( \widehat{l_i^R} \right)^{\frac{\theta (\beta + \lambda)}{1 + \theta \lambda}} + \widehat{\chi}^{\frac{\theta \lambda}{1 + \theta \lambda}} \sum_j \left( \frac{\Xi_{ji}}{L_i^R + \sum_j \Xi_{ji}} \right) \widehat{t}_{ji}^{-\frac{\theta}{1 + \theta \lambda}} \left( \widehat{l_j^F} \right)^{\frac{1 - \alpha \theta}{1 + \theta \lambda}}$$

#### Counterfactuals

• Standard model: write system in changes using observed data:

• With traffic congestion:

$$\left( \hat{l}_{i}^{\widehat{R}} \right)^{-\theta\beta+1} \left( \hat{l}_{i}^{\widehat{F}} \right)^{\frac{\theta\lambda(1-\alpha\theta)}{1+\theta\lambda}} = \hat{\chi} \left( \frac{L_{i}^{F}}{L_{i}^{F} + \sum_{j} \Xi_{ij}} \right) \left( \hat{l}_{i}^{\widehat{F}} \right)^{\frac{\theta(\alpha+\lambda)}{1+\theta\lambda}} + \hat{\chi}^{\frac{\theta\lambda}{1+\theta\lambda}} \sum_{j} \left( \frac{\Xi_{ij}}{L_{i}^{F} + \sum_{j} \Xi_{ij}} \right) \hat{t}_{ij}^{-\frac{\theta}{1+\theta\lambda}} \left( \hat{l}_{i}^{\widehat{R}} \right)^{\frac{1-\beta\theta}{1+\theta\lambda}}$$

$$\left(\widehat{l_i^R}\right)^{\frac{\theta\lambda(1-\beta\theta)}{1+\theta\lambda}} \left(\widehat{l_i^F}\right)^{-\theta\alpha+1} = \widehat{\chi}\left(\frac{L_i^R}{L_i^R+\sum_j \Xi_{ji}}\right) \left(\widehat{l_i^R}\right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta\lambda}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R+\sum_j \Xi_{ji}}\right) \widehat{t}_{ji}^{-\frac{\theta}{1+\theta\lambda}} \left(\widehat{l_j^F}\right)^{\frac{1-\alpha\theta}{1+\theta\lambda}} \left(\widehat{l_j^F}\right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R+\sum_j \Xi_{ji}}\right) \widehat{t}_{ji}^{-\frac{\theta}{1+\theta\lambda}} \left(\widehat{L}_j^R\right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R+\sum_j \Xi_{ji}}\right) \widehat{t}_{ji}^{-\frac{\theta}{1+\theta\lambda}} \left(\widehat{L}_j^R\right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R+\sum_j \Xi_{ji}}\right) \widehat{t}_{ji}^{-\frac{\theta}{1+\theta\lambda}} \sum_j \left(\widehat{L}_j^R\right)^{\frac{\theta(\beta+\lambda)}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R+\sum_j \Xi_{ji}}\right) \widehat{t}_{ji}^{-\frac{\theta}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\widehat{L}_j^R\right)^{\frac{\theta}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R}\right) - \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\widehat{L}_j^R\right)^{\frac{\theta}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\frac{\Xi_{ji}}{L_i^R}\right) - \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} - \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} \sum_j \left(\widehat{L}_j^R\right)^{\frac{\theta}{1+\theta\lambda}} + \widehat{\chi}^{\frac{\theta}{1+\theta\lambda}} - \widehat{\chi}^{\frac{\theta}$$

• Same close marriage between theory and data, but now using traffic data!

## Outline of Talk

Introduction

A Quantitative Urban Framework with Traffic Congestion

#### The welfare impacts of improving the Seattle road network Empirical Context & Data

Estimation The welfare impacts of improving the Seattle Road Network

Conclusion

# Why Seattle?

- The traffic in Seattle is bad.
  - Second highest commute times in the U.S.
  - No major public transportation system.

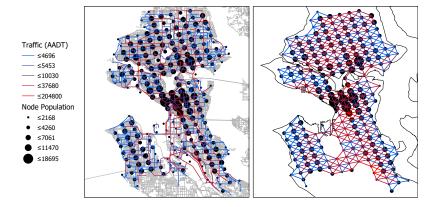

# Why Seattle?

- The traffic in Seattle is bad.
  - Second highest commute times in the U.S.
  - No major public transportation system.
- The data in Seattle is good.
  - For roughly 1,500 miles of roads, we observe traffic, length, location, number of lanes, speed limit (HPMS)
  - Residential, workplace populations in each census block group (LODES).
  - Note: HPMS & LODES available throughout U.S.

# Why Seattle?

- The traffic in Seattle is bad.
  - Second highest commute times in the U.S.
  - No major public transportation system.
- The data in Seattle is good.
  - For roughly 1,500 miles of roads, we observe traffic, length, location, number of lanes, speed limit (HPMS)
  - Residential, workplace populations in each census block group (LODES).
  - Note: HPMS & LODES available throughout U.S.
- The geography is interesting.
  - Water & bridges result in natural bottlenecks in road network.

#### The Seattle Road Network

## Outline of Talk

Introduction

A Quantitative Urban Framework with Traffic Congestion

The welfare impacts of improving the Seattle road network Empirical Context & Data Estimation The welfare impacts of improving the Seattle Road Network

Conclusion

- To evaluate welfare impacts, only need to know four elasticities:
  - 1. Preference heterogeneity  $\theta$ .
  - 2. Productivity spillover  $\alpha$ .
  - 3. Amenity spillover  $\beta$ .
  - 4. Traffic congestion parameter  $\lambda$ .

- To evaluate welfare impacts, only need to know four elasticities:
  - 1. Preference heterogeneity  $\theta$ .  $\leftarrow$  We set  $\theta = 4$  (Monte et al. '18).
  - 2. Productivity spillover  $\alpha$ .
  - 3. Amenity spillover  $\beta$ .
  - 4. Traffic congestion parameter  $\lambda$ .

- To evaluate welfare impacts, only need to know four elasticities:
  - 1. Preference heterogeneity  $\theta$ .  $\leftarrow$  We set  $\theta = 4$  (Monte et al. '18).
  - 2. Productivity spillover  $\alpha$ .  $\leftarrow$  We set  $\alpha = 0.1$  (Roca & Puga '17).
  - 3. Amenity spillover  $\beta$ .
  - 4. Traffic congestion parameter  $\lambda$ .

  - 3. Amonity spillover  $\beta$ .  $\leftarrow$  We set  $\beta = -0.3$  (C-D share of housing).
  - 4. Traffic congestion parameter  $\lambda$ .  $\leftarrow$  We estimate this.

# Estimation of Traffic Congestion

- Assume:
  - 1. Link costs increasing in travel time:

 $\ln t_{kl} = \delta_0 \ln time_{kl}$ 

## Estimation of Traffic Congestion

- Assume:
  - 1. Link costs increasing in travel time:

 $\ln t_{kl} = \delta_0 \ln time_{kl}$ 

2. Speed is decreasing in traffic (AADT) per lane-mile:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \delta_{kl},$$

## Estimation of Traffic Congestion

- Assume:
  - 1. Link costs increasing in travel time:

 $\ln t_{kl} = \delta_0 \ln time_{kl}$ 

2. Speed is decreasing in traffic (AADT) per lane-mile:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \delta_{kl},$$

#### • Then:

1. Consistent with theory, we have:

$$\ln t_{kl} = \underbrace{\delta_0 \ln distance_{kl} - \delta_0 \delta_1 lanes_{kl} - \delta_0 \delta_{kl}}_{\equiv \ln \overline{t}_{kl}} + \underbrace{\delta_0 \delta_1}_{\equiv \lambda} \ln \Xi_{kl}$$

• Note: Constructing more lane-miles reduces  $\overline{t}_{kl}$ .

## Estimation of Traffic Congestion

- Assume:
  - 1. Link costs increasing in travel time:

 $\ln t_{kl} = \delta_0 \ln time_{kl}$ 

2. Speed is decreasing in traffic (AADT) per lane-mile:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \delta_{kl},$$

#### • Then:

1. Consistent with theory, we have:

$$\ln t_{kl} = \underbrace{\delta_0 \ln distance_{kl} - \delta_0 \delta_1 lanes_{kl} - \delta_0 \delta_{kl}}_{\equiv \ln \overline{t}_{kl}} + \underbrace{\delta_0 \delta_1}_{\equiv \lambda} \ln \Xi_{kl}$$

- Note: Constructing more lane-miles reduces  $\overline{t}_{kl}$ .
- 2. Simple estimating equation:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \underbrace{\mathbf{X}_{kl\beta} + \varepsilon_{kl}}_{\equiv \delta_{kl}}$$

Estimation of Traffic Congestion (ctd.)

• Estimating equation from last slide:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \underbrace{\mathbf{X}_{kl}\beta + \varepsilon_{kl}}_{\equiv \delta_{kl}}$$

Estimation of Traffic Congestion (ctd.)

• Estimating equation from last slide:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \underbrace{\mathbf{X}_{kl}\beta + \varepsilon_{kl}}_{\equiv \delta_{kl}}$$

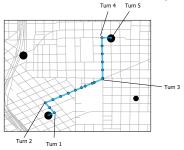

• Need an IV for traffic uncorrelated with free flow rate of speed.

Estimation of Traffic Congestion (ctd.)

• Estimating equation from last slide:

$$speed_{kl} = -\delta_1 \ln \left( \frac{\Xi_{kl}}{lanes_{kl}} \right) + \underbrace{\mathbf{X}_{kl}\beta + \varepsilon_{kl}}_{\equiv \delta_{kl}}$$

- Need an IV for traffic uncorrelated with free flow rate of speed.
  - Solution: Number of turns (conditional on number of intersections).

• Intuition: Intersections uniformly costly, turns annoying.

#### Table: Estimating the strength of traffic congestion

	(1)	(2)	(3)	(4)	(5)
Travel Time Optimized	OLS	IV: 1st stage	IV	IV: 1st stage	IV
AADT per Lane	-0.048***		0.118**		$0.488^{*}$
	(0.007)		(0.048)		(0.278)
Turns along Route		$-0.252^{***}$		-0.091**	
		(0.049)		(0.039)	
F-statistic	41.546	26.347	6.191	5.336	3.084
R-squared	0.766	0.721	-0.450	0.875	-2.757
Observations	1338	1338	1338	1338	1338
Start-location FE	Yes	Yes	Yes	Yes	Yes
End-location FE	Yes	Yes	Yes	Yes	Yes
No. of Intersections	No	Yes	Yes	Yes	Yes
Bilateral Route Quality	No	No	No	Yes	Yes

• Implies  $\lambda = 0.11$ .

# Outline of Talk

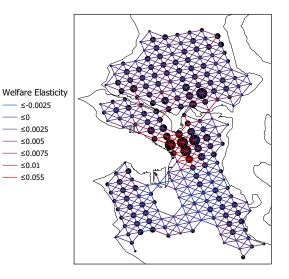

Introduction

A Quantitative Urban Framework with Traffic Congestion

The welfare impacts of improving the Seattle road network Empirical Context & Data Estimation The welfare impacts of improving the Seattle Road Network

Conclusion

Welfare elasticities  $\left(\frac{\partial \ln W}{\partial \ln \bar{t}_{kl}}\right)$  of improving each link

•  $\sim 10\%$  of links are welfare *reducing* (Braess paradox in action!)

Calculating the Returns on Investment

• Calculate the annual return on investment for an additional lane-mile on every segment.

Calculating the Returns on Investment

- Calculate the annual return on investment for an additional lane-mile on every segment.
- Benefits:

$$\frac{\partial \ln W}{\partial \ln \text{lanes}_{kl}} = \delta_0 \delta_1 \times \frac{\partial \ln W}{\partial \ln \overline{t}_{kl}}$$

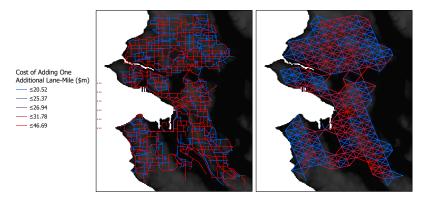

Calculating the Returns on Investment

- Calculate the annual return on investment for an additional lane-mile on every segment.
- Benefits:

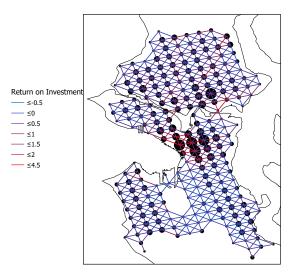

$$\frac{\partial \ln W}{\partial \ln \text{lanes}_{kl}} = \delta_0 \delta_1 \times \frac{\partial \ln W}{\partial \ln \overline{t}_{kl}}$$

• *Costs*: Latest estimates from Federal Highway Administration (FHWA) by road type & location. Assume 10 year linear depreciation.

## Estimated Annualized cost of an Additional Lane-mile

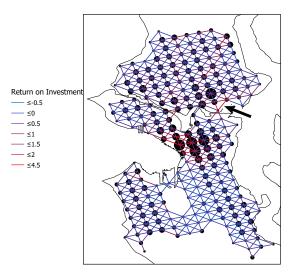

## Return on Investment of Infrastructure Investment

• Huge heterogeneity in ROI: Mean: 17%, Median: 8%, SD: 37%.

## Return on Investment of Infrastructure Investment

• Huge heterogeneity in ROI: Mean: 17%, Median: 8%, SD: 37%.

## Return on Investment of Infrastructure Investment

#### Seattle City Council won't back second Montlake Bridge

Posted on Wednesday, September 25, 2019 - 7:00 am by jseattle

A 10-year-old rendering of what a second Montlake Bridge could look like — via Madison Park Blogger

The state has the funds to build it but the **Seattle City Council** won't — yet — back a resolution supporting a second bascule bridge connecting through the transit chokepoint between Montlake and light rail at Husky Stadium.

## Conclusion

- To bolster the quantitative revolution, introduce new urban framework with traffic congestion:
  - Same analytical tractability, close marriage between theory and data.
  - New implications for welfare impacts of road construction.

## Conclusion

- To bolster the quantitative revolution, introduce new urban framework with traffic congestion:
  - Same analytical tractability, close marriage between theory and data.
  - New implications for welfare impacts of road construction.
- Future work could leverage wide-spread availability of traffic data to better design infrastructure networks in locations where commuting data is scarce (e.g. in developing countries).
