W4 DRUGS TAKEN DURING PREGNANCY, ACTIVE COMPOUNDS

The Drugs Taken During Pregnancy, Active Compounds work file was created in the 1970s by Drs. Dennis Slone, O.P. Heinonen, R.R. Monson, E.B. Hook and Samuel Shapiro of the Drug Epidemiology Unit, Boston University Medical Center under contract N01-NS-2-2322.

This work file, like work file W3, is the by-product of the analysis of the relationships between antenatal drug exposure and the appearances of malformations in the offspring. Before the analysis was undertaken, the drug data in the NCPP master file were reviewed and evaluated. This evaluation led to the reclassification, reorganization and recoding of the NCPP drug data. To create this file each ingredient of each drug was identified by its generic name. The data were then reorganized and the pharmacologically active compounds coded by lunar month of use.

Information on the collection of NCPP drug data and its preparation for analysis can be found in:

Heinonen, OP, D. Slone, S. Shapiro. 1977. Birth Defects and Drugs In Pregnancy. Littleton, MA: Publishing Sciences Group, Inc.

This work file contains data on 49,214 women. The cohort excludes the following:

- Non-core cases (did not meet sampling rules)
- Walk-ins (registered and delivered/aborted on the same day)
- Non-responders (cases lost prior to delivery)
- Orientals and other small race groups
- Pregnancies terminating in multiple births
- Abortions
- Clinically evident rubella during pregnancy
- Mothers of offspring not examined for malformation or tumor
- Drug usage during pregnancy unknown or unspecific drug information
- Cases in which the following data were unavailable
 - Sex of offspring
 - Birthweight of offspring
 - Previous pregnancy of the mother
 - Complications of the study gestation (except vomiting and umbilical cord pathology)
 - Diseases during study pregnancy

Each record contains 15 data items, the 9 digit NINDB case number, the 4 digit active compound code, 12 positions that contain a code for the frequency of drug use in each lunar month of pregnancy, including four weeks prior to the last menstrual period, and 1 position that contains a code for the frequency of drug use when the month is unknown. The file contains one record for each active compound used by the 49,214 gravida.

Two examples will illustrate how these data were constructed. Refer to the data coding instructions for the details of the coding scheme used.

Consider patient AAAAAAAAAA who used Trisulfapyrimidine one day in the second lunar month, 1 to 7 days in the third lunar month, more than 7 days in the fourth lunar month and then discontinued use of this drug. The 5 records generated would be:

```
AAAAAAAAA03060012300000000 -- 306 = pheniramine
AAAAAAAAA10080012300000000 -- 1008 = suladiazine
AAAAAAAAA10330012300000000 -- 1033 = sulfamerazine
AAAAAAAAA10530012300000000 -- 1053 = sulfamethazine
AAAAAAAAA31620012300000000 -- 3162 = pyrilamine
```

Consider patient: BBBBBBBBBB who used Acetylphen (code 7268) on one day of each of the first three months and aspirin (code 2017) on one day of the sixth and seventh months. Note that aspirin is an active compound in both drugs taken by this patient.

The two records generated would be:

```
BBBBBBBBB820170111001100000 -- 2017 = aspirin
BBBBBBBBB20300111000000000 -- 2030 = phenobarbital
```

Work file W4, Drugs Taken During Pregnancy, Active Compounds, or work file W3, Drugs Taken During Pregnancy, Trade Names should be used instead of the drug data on the master file.

WORK FILE CHARACTERISTICS

This work file contains 253,154 records for 49,214 cases. Each record is 30 characters in length. The file is available on 1600 bpi 9 track tape with 6000 characters per block.
