User Guide to the 2016 Natality Public Use File

Acknowledgments

The preparation of this User Guide was coordinated by Anne K. Driscoll in the Division of Vital Statistics (DVS) under the general direction of Joyce A. Martin, Lead Statistician, Reproductive Statistics Branch (RSB), DVS.

The Division of Vital Statistics Director, Delton Atkinson, managed the Vital Statistics Cooperative Program through which the vital registration offices of all states, the District of Columbia, New York City, Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands provided the data to the National Center for Health Statistics (NCHS).

The vital statistics computer file on which it is based was prepared by DVS staff. This Division also processed computer edits, designed and programmed the tabulations, reviewed the data, prepared documentation for this file, and was responsible for receipt and processing of the basic data file. Rajesh Virkar and Karen Knight provided overall direction. Important contributors were, Laci Banks-Walker, Senora Davis, Patrick Drake, Danielle M. Ely, Catherine Forbes, Connie M. Gentry, Brenda A. Green, Brady E. Hamilton, Margaret Jamison, Christina K. Jarman, David W. Justice, Virginia J. Justice, Kryn Krautheim, Denise Little, Annie S. Liu, Susan L. McBroom, Jasmine N. Mickens, Enudio Mercado-Gonzalez, Michelle J.K. Osterman, Steven J. Steimel, Pam Stephenson, George C. Tolson, and Tewodros K. Weldeamlak..

Michelle J.K. Osterman, Brady E. Hamilton, and Elizabeth C. W. Gregory reviewed and verified these technical notes.

NCHS acknowledges the essential role of the vital registration offices of all states and territories in maintaining the system through which vital statistics data are obtained and their cooperation in providing the information on which this publication is based.

Table of Contents

Control count of records	7
File layout	8
County codes	42
Detailed Technical Notes	48
Introduction	49
Definition of Live Birth	49
The Birth Registration Area	50
Classification of births by occurrence and residence	51
Residence error	51
Population based rates	51
Geographic classification	51
Standard Certificates of Live Birth	52
2003 revision	52
Natality data files	53
Micro-data files	53
Demographic Characteristics	53
Hispanic origin and race	53
Hispanic origin	53
Change in births to "other and unknown Hispanic" women	54
Race of mother and father	54
Age of mother	55
Imputation of age of mother	55
Extreme values of age	55
Mean age of mother	55
Not stated age or date of birth of mother	56
Age of father	56
Marital status	56
Inferential procedures	56
Imputation of marital status	56
Educational attainment	57
Mother	57
Father	57

Live-birth order and parity	57
Birth interval	58
Medical and Public Services Utilization	58
Prenatal care	58
WIC food during pregnancy	58
Obstetric procedures	59
Characteristics of labor and delivery	59
Place of birth	60
Planned home births	60
Time of birth	60
Attendant at birth	60
CNM/CM-attended births	61
Method of delivery	61
Trial of labor	61
Total cesarean rate	61
Low-risk cesarean rate	62
Primary cesarean and VBAC delivery rates	62
Source of payment for the delivery	62
Maternal Lifestyle and Health Characteristics	63
Mother's body mass index (BMI)	63
Mother's height	63
Mother's pre-pregnancy weight	63
Mother's weight at delivery	63
Weight gain during pregnancy	64
Cigarette smoking before and during pregnancy	64
Quitting smoking before or during pregnancy	64
Risk factors in this pregnancy	65
Eclampsia	65
Pregnancy from infertility treatment	65
Infections present and/or treated during this pregnancy	66
Maternal morbidity	66
Infant Health Characteristics	67
Period of gestation	67
Birthweight	67

Apgar score	68
5-minute score	68
10-minute score	68
Abnormal conditions of the newborn	69
Congenital anomalies of the newborn	69
Down syndrome and suspected chromosomal disorder	70
Plurality	70
Infant breastfed	70
Quality of Data	71
Completeness of registration	71
Completeness of reporting	71
Quality control procedures	71
Comparison with medical records	72
Rarely occurring events	72
State-specific data quality issues for 2016	72
Computation of Rates and Other Measures	74
Population denominators	74
2016 population estimates	74
Population estimates for the specific Hispanic groups	75
Revised population estimates	75
Residential population base	75
Small populations as denominators	76
Net census undercounts and overcounts	76
Cohort fertility tables	76
Total fertility rates	76
Seasonal adjustment of rates	76
Computation of percentages, percentage distributions, and means	77
Computation of Measures of Variability	77
Random variation and significance testing for natality data	77
Specified Hispanic population groups	77

DETAILED TECHNICAL NOTES UNITED STATES 2016 NATALITY

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES

CENTERS FOR DISEASE CONTROL AND PREVENTION NATIONAL CENTER FOR HEALTH STATISTICS

Hyattsville, Maryland: 2016

Introduction

These Detailed Technical Notes, published by the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS), supplement the "Technical Notes" section of "Births: Final Data for 2016" [1], and are for use with the 2016 Natality public use data. The 2016 natality micro-data file may be downloaded at http://www.cdc.gov/nchs/data_access/VitalStatsOnline.htm [2]. The micro-data natality file does not include geographic detail (e.g., state or county of birth). Selected natality data, including some geographic data, are available in CDC WONDER (http://wonder.cdc.gov). CDC WONDER is an interactive online data access tool that provides selected natality data from 1995-2016. Beginning with the 2016 data, all items available in the public use file will be available in CDC WONDER.

A review of 2003-based birth certificate revision items in 2014 and 2015 by a collaborative effort among representatives from several vital statistics jurisdictions: The National Association for Public Health Statistics and Information Systems (NAPHSIS), and NCHS, resulted in the decision to drop a number of items from the national birth certificate data file for reasons of poor data quality. For more information on this effort and for a full list of items that were dropped, see https://www.cdc.gov/nchs/nvss/deleted_items_from_birth_fetal_death_files.htm.

Key natality items are presented in "Births in the United States, 2016," which will accompany the release of the 2016 public use file [2]. Information on other items can be found in the upcoming 2016 final report and accompanying internet tables [1]. Additional discussion of selected items (e.g., use of infertility treatment, time of birth, and interpregnancy interval) is available in recent reports [3-7]. An assessment of the quality of many medical and health items is available in "Assessing the quality of medical and health data from the 2003 birth certificate revision: Results from two states" [8].

Table B presents a listing of items and the percentage of records that were not stated for all reporting areas: each state, New York City, the District of Columbia, plus Puerto Rico, Guam, the U.S. Virgin Islands, American Samoa, and the Northern Marianas.

Definition of Live Birth

Every product of conception that gives a sign of life after birth, regardless of the length of the pregnancy, is considered a live birth. This concept is included in the definition set forth by the World Health Organization in 1950 as described in a United Nation's Handbook [9]. A slightly expanded definition of live birth was recommended by the 1992 and 2011 revisions of the Model State Vital Statistics Act and Regulations [10,11], based on recommendations of a 1988 working group formed by

the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists [12] and is consistent with that currently used by the WHO in the ICD-10 [13] and the United Nations:

"Live birth" means the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes, or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

This definition distinguishes a live birth from a fetal death in precise terms [14,15]. The vast majority of registration areas use definitions of live births similar to this definition [14]. All states require the reporting of live births regardless of length of gestation or birth weight.

The Birth Registration Area

The birth registration system of the United States includes the 50 states, the District of Columbia, the independent registration area of New York City, and Puerto Rico, the U.S. Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands (referred to as Northern Marianas). In statistical tabulations, "United States" refers only to the aggregate of the 50 states (including New York City) and the District of Columbia. Information on the history and development of the birth-registration area is available elsewhere [16].

Natality statistics for all states and the District of Columbia are based on information for all births registered in the reporting areas. The information is received on electronic files consisting of individual records processed by the states, the District of Columbia, New York City, Puerto Rico, the U.S. Virgin Islands, American Samoa, and the Northern Marianas. NCHS receives these files from the registration offices of all states, the two cities and four territories through the Vital Statistics Cooperative Program. Information for Guam for 2016 is obtained from paper copies of original birth certificates, which are coded and keyed by NCHS. For historical information on the birth registration system, see the User Guide to the 2014 Natality Public Use File [17].

U.S. natality data are limited to births occurring within the United States, including those occurring to U.S. residents and nonresidents. Births to nonresidents of the United States have been excluded from most published tabulations by place of residence (for further discussion see "Classification by occurrence and residence"). Births occurring to U.S. citizens or residents outside the

United States are not included in the natality file. Data for Puerto Rico, the U.S. Virgin Islands, Guam, American Samoa, and the Northern Marianas are limited to births registered in these areas.

Classification of births by occurrence and residence

In tabulations by place of residence, births occurring within the United States to U.S. citizens and to residents who are not citizens are allocated to the usual place of residence of the mother in the United States, as reported on the birth certificate. Births to U.S. residents occurring outside this country are not included in tabulations by place of residence or place of occurrence.

The total count of births for the United States by place of residence and by place of occurrence will not be identical. Births to nonresidents of the United States are included in data by place of occurrence but excluded from data by place of residence, as previously indicated. See **Table A** for the number of births by residence and occurrence for the 50 states and the District of Columbia for 2016.

Residence error: According to a 1950 test (which has not been repeated), errors in residence reporting for the country as a whole tend to overstate the number of births to residents of urban areas and to understate the number of births to residents of other areas [18]. Recent experience, based on anecdotal evidence from the states, suggests that this is still a concern. This tendency has assumed special importance because of a concomitant development—the increased utilization of hospitals in cities by residents of nearby places—with the result that a number of births are erroneously reported as having occurred to residents of urban areas. Another factor that contributes to this overstatement of urban births is the customary practice of using city addresses for persons living outside the city limits. Residence error should be taken into particular consideration in interpreting tabulated data for small areas. Both birth and infant mortality patterns can be affected.

Population-based rates: One of the principal values of vital statistics data is realized through the presentation of rates that are computed by relating the vital events of a class to the population of a similarly defined class (e.g., 2016 births to women aged 20-24 years and the 2016 population of women aged 20-24). Vital statistics and population statistics, therefore, must be tabulated in comparable groups. Even when the variables common to both, such as geographic area, age, race, and sex, have been similarly classified and tabulated, significant discrepancies may result from differences between the enumeration method of obtaining population data and the registration method of obtaining vital statistics data [19].

Geographic classification: The geographic code structure for the 2016 natality file is given in the NCHS manual, "Vital Records Geographic Classification, 2014," and in the country, county, and place

geographic code files [20,21]. The geographic code structure on the 2016 file is based on results of the 2010 Census of Population.

Standard Certificates of Live Birth

The U.S. Standard Certificate of Live Birth, issued by the U.S. Department of Health and Human Services, has served for many years as the principal means for attaining uniformity in the content of the documents used to collect information on births in the United States. The U.S. Standard Certificate of Live Birth has historically been revised every 10-15 years. Most state certificates conform closely in content to the standard certificate, but are modified to the extent required by the particular state's needs or by special provisions of the state's vital statistics law.

The 2003 revision: In 2003, a revised U.S. Standard Certificate of Live Birth was adopted (**Figure 1**). For more information on the 2003 standard certificate and details regarding the certificate revision and links to the documents referenced below, see the NCHS website of the 2003 certificate revision at http://www.cdc.gov/nchs/nvss/vital certificate revisions.htm. The 2003 birth certificate replaces the previous 1989 U.S. Standard Certificate of Live Birth [22,23]. Implementation of the 2003 U.S. Standard Certificate of Live Birth (revised) by the states and independent reporting areas was phased in from 2003 to 2016. All states, the District of Columbia, Guam, Puerto Rico, the U.S. Virgin Islands, and the Northern Marianas had implemented the revised birth certificate as of January 1, 2016 (see User Guide to the 2015 Natality Public Use File [24] for a detailed implementation schedule).

The 2003 Revision of the U.S. Standard Certificate of Live Birth introduced substantial changes to data content and quality. Many key data items are common between revisions; however, a number of items were substantively modified. The 2003 revision also includes many new items never before collected on the Standard Certificate [22,23]. For details on data items comparable between revisions see the User Guide to the 2014 Natality Public Use File [17].

A key aspect of the 2003 revision of the U.S. Standard Certificate of Live Birth was the reengineering of the data collection and transmission system to improve data quality, speed of data collection and transmission, and to enhance standardization of data [22,25]. To encourage collection of data from the best sources, two worksheets were developed: the "Mother's Worksheet" (available at https://www.cdc.gov/nchs/data/dvs/moms-worksheet-2016.pdf) [26] and the "Facility Worksheet" (available at https://www.cdc.gov/nchs/data/dvs/facility-worksheet-2016.pdf) [27]. In the Mother's Worksheet, data are directly obtained from the mother and include items such as race, Hispanic origin and educational attainment. For the Facility Worksheet, data are obtained directly from the medical

records of the mother and infant for items such as date of first prenatal care visit, pregnancy risk factors, and method of delivery. To assist hospital staff in completing the Facility Worksheet, a comprehensive instruction manual was developed: Guide to Completing the Facility Worksheets for the Certificate of Live Birth and Report of Fetal Death (2003 Revision) ("Guide to the Facility Worksheet"; available at https://www.cdc.gov/nchs/data/dvs/GuidetoCompleteFacilityWks.pdf) [28]. Detailed definitions and instructions for data items that are collected from the Facility Worksheet are in the "Guide to the Facility Worksheet".

Detailed descriptions of editing and computation methods of the items described below are available [29,30].

Natality data files

Micro-data files: Natality micro-data files for data years 1968-2016 may be downloaded at http://www.cdc.gov/nchs/data_access/VitalStatsOnline.htm. The general rules used to classify characteristics of live births are presented in several NCHS manuals [20,21,25,29,30]. These instructions are for states to use to collect and code the data items; they do not include NCHS edit recodes.

The 2003-2015 edits and natality micro-data files include data items common to both the 1989 and 2003 revisions of the U.S. Standard Certificate of Live Birth. The files also include items exclusive to the 2003 revision. See the file layout in this User Guide. Certain data items new to the 2003 revised certificate (e.g., maternal morbidity) are available beginning with data files 2009.

Beginning with the 2005 data year, the public release micro-data natality file no longer includes geographic detail (e.g., state or county of birth). Information on the data use policy is available at http://www.cdc.gov/nchs/nvss/dvs_data_release.htm [31].

Demographic Characteristics

Hispanic origin and race

Hispanic origin: Hispanic origin and race are reported separately on the birth certificate (**Figure** 1). It is recommended that this information be reported directly by the mother via the Mother's Worksheet [26].

Data on the public use file and in NCHS reports for specified Hispanic groups are shown in most cases for five specified Hispanic groups: Mexican, Puerto Rican, Cuban, Central and South American, and "other and unknown Hispanic". In tabulations of birth data by race and Hispanic origin, data for

persons of Hispanic origin are not further classified by race because the vast majority of Hispanic women are reported as white. In tabulations of birth data by race only, data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race. In tabulations that include Hispanic origin, data for non-Hispanic persons are classified according to the race of the mother, due to substantial differences in fertility and maternal and infant health characteristics between Hispanic and non-Hispanic white women. American Samoa does not currently collect information on Hispanic origin.

The Hispanic origin question asks respondents to select only one response. Occasionally, however, more than one Hispanic origin response is given, that is, a specified Hispanic group (Mexican, Puerto Rican, Cuban, or Central and South American) in combination with one or more other specified Hispanic group. From 2003 through 2012, respondents who selected more than one Hispanic origin on the birth certificate were classified as "other Hispanic". Beginning with the 2013 data year, respondents who select more than one Hispanic origin are randomly assigned to a single Hispanic origin. This change was implemented to be consistent with the coding methods of the American Community Survey [32], on which the rates for the specified Hispanic groups from 2010 on are based (see "Population estimates for the specific Hispanic groups").

The percentage of records for which Hispanic origin of the parents was not reported in 2016 is presented by reporting area in **Table B**.

Change in births to "other and unknown Hispanic" women: The number of births to "other and unknown Hispanic" women increased by 1.3 percent from 143,536 in 2015 to 145,381 in 2016, increasing steadily from 48,972 in 2003. Factors that may have influenced this rise are not clear but may include less specificity in respondent reporting of Hispanic origin and increases in the populations of groups included in the "other Hispanic" category.

Race of mother and father: Reported separately from Hispanic origin, the instructions are to check one or more races to indicate what the mother/father considers her/himself to be. It is recommended that this information be reported directly by the mother via the Mother's Worksheet [26]. The 2003 revision of the U.S. Standard Certificate of Live Birth allows the reporting of the five race categories either alone (i.e., single-race) or in combination (i.e., more than one race or multiple races) for each parent [23], in accordance with the revised standards issued by the Office of Management and Budget (OMB) in 1997 [33]. The five categories for race specified in the revised standards are:

American Indian or Alaska Native (AIAN), Asian, Black or African American, Native Hawaiian or Other Pacific Islander (NHOPI), and White. Information on this change is presented elsewhere [34-36].

Starting in 2016, all states and the District of Columbia, in addition to Puerto Rico, the U.S. Virgin Islands, Guam and Northern Marianas, reporting race according to the 1997 revised OMB standards, with 2.5% of mothers in the U.S. reporting more than one race (Documentation Table 1).

Data from American Samoa still follow the 1977 OMB standards, which required a minimum set of four single-race categories [American Indian or Alaska Native (AIAN), Asian or Pacific Islander (API, with Asian combined with Pacific Islander), black, and white] and to allow respondents to select only one race category [37].

Where race of the mother is not reported, if the race of the father is known, the race of the father is assigned to the mother. When information is not available for either parent, the race of the mother is imputed according to the specific race of the mother on the preceding record with a known race of mother. In 2016, race of mother was imputed for 6.1% of births (by occurrence).

Beginning in 2016, data by race are shown according to the 1997 OMB standards. Data for "bridged-race" categories for 2016 are shown in **Tables I-26** to **I-35**. For details on the processing of "bridged-race," see User Guide to the 2014 Natality Public Use File [17].

Age of mother

The age of mother is derived from the reported month and year of birth. It is recommended that this information be reported directly by the mother via the Mother's Worksheet [26]. For American Samoa, exact age of mother was reported.

Imputation of age of mother: Age of mother is imputed for ages 8 years or under and 65 years and over (mother's age 9 years is recoded as 10 years and ages 55-64 years are recoded to an age from 50-54 years). A review and verification of unedited data for several years showed that the vast majority of births reported as occurring to women aged 50 years and older were to women aged 50-54 years.

Extreme values of age: Data for single year of age of mother 9-11 and 55-64 years are not shown in the public use data files. Births to mothers 9-11 years are collapsed into the categories "12 years or under;" births to mothers 50-64 years into the category "50-54 years".

Mean age of mother: Mean age is the arithmetic average of an age distribution Trend data on the mean age of mother, derived directly from frequencies of births by age, are available at https://www.cdc.gov/nchs/products/vsus.htm#natab2003, [38] and for recent years, in **Table I-6** of the 2016 Final Report [1]. For information on median age of mother, see User Guide for the 2014 Natality Public Use File [17].

Not stated age or date of birth of mother: Beginning in 1964, birth records with date of birth of mother and/or age of mother not stated have had age imputed according to the age of mother from the previous birth record of the same race and total-birth order (total of fetal deaths and live births). (See NCHS Instruction Manuals, Part 12 [30,39]).

Age of father

Information on age of father is derived from the father's date of birth and is recommended to be reported directly by the mother. See the Mother's Worksheet [26]. Information on age of father is often missing for children born to unmarried mothers, greatly inflating the number in the "Not stated" category in all tabulations by age of father. If the age is under 10 years, it is considered not stated and grouped with those cases for which age is not stated on the certificate. See also the NCHS manual for detailed descriptions of editing and computation methods [29] and **Table B** for the percent of records for which father's age is not stated.

Marital status

National estimates of births to unmarried women are based on two methods of determining marital status: 1) direct question; and 2) inferential procedures (described below). For more details on the history of the two methods, see the User Guide for the 2014 Natality Public Use File [17].

It is recommended that information on marital status be reported directly by the mother using the Mother's Worksheet [26]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Tables 9**, **10**, and **I-7** of the 2016 Final Report [1].

Inferential procedures: Historical information on inferential procedures can be found in the 2014 User Guide [17]. In 2016, inferential procedures were used to compile birth statistics by marital status in full or in part for New York. In New York, a birth is inferred as nonmarital if either of these factors, listed in priority-of-use order, is present: a paternity acknowledgment was received or the father's name is missing. In recent years, a number of states have extended their efforts to identify the fathers when the parents are not married in order to enforce child support obligations. The presence of a paternity acknowledgment, therefore, is the most reliable indicator that the birth is nonmarital in the states not reporting this information directly. Details of the changes in reporting procedures and the impact of the procedures on the data are described in previous reports [40,41].

Imputation of marital status: Mother's marital status was not reported in 2016 on 0.05 percent of the birth records where this information is obtained exclusively by a direct question (i.e., in the 49 states,

the District of Columbia, and New York City). Marital status was imputed for these records. If status was unknown and the father's age was known, then the mother was considered married. If the status was unknown, and the father's age unknown, then the mother was considered unmarried.

Educational attainment

Mother: Educational attainment is based on the highest degree or level of school completed at the time of the delivery. It is recommended that information on educational attainment of the mother be reported directly by the mother using the <u>Mother's Worksheet</u> [26]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-8** of the 2016 Final Report [1], and **Table B** for the percent of records for which mother's education is not stated.

Father: The question on educational attainment of the father is parallel to that for the mother. Information on education of father is often missing on birth certificates of children born to unmarried mothers, greatly inflating the number in the "Not stated" category. While the overall percentage of "Not stated" records for the United States was 14.1 percent (**Table B**), this information was missing for more than one-third of records for two states (Delaware and Wisconsin).

Live-birth order and parity

Live-birth order and parity are determined from two items on the birth certificate, "Number of previous live births now living" and "Number of previous live births now dead." Live-birth order and parity classifications refer to the total number of live births the mother has had including the 2016 birth. Fetal deaths are excluded.

Live-birth order indicates what number the present birth represents; for example, a baby born to a mother who has had two previous live births (even if one or both are not now living) has a live-birth order of three. Parity indicates how many live births a mother has had. Before delivery, a mother having her first baby has a parity of zero, and a mother having her third baby has a parity of two. After delivery the mother of a baby who is a first live birth has a parity of one, and the mother of a baby who is a third live birth has a parity of three.

It is recommended that prenatal care information be collected directly from the prenatal care record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for these items are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Table B** for the percent of records for which live birth order is not stated.

In computing birth rates by live-birth order, births tabulated as birth order not stated are distributed in the same proportion as births of known live-birth order.

Birth interval

Birth intervals are computed for all births of second or higher order. The interval is computed from the infant's date of birth (month and year) and the date of the last live birth (month and year). In a plural delivery, the second and higher order birth within a set is classified at an interval of 0-3 months.

It is recommended that prenatal care information be collected directly from the prenatal care record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for these items are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-10** of the 2016 Final Report [1], and **Table B** for the percent of records for which birth interval is not stated.

Medical and Public Services Utilization

Prenatal care

Information on the timing and number of prenatal care visits is collected from the items "Date of first prenatal visit" (with a checkbox for "No prenatal care") and "Total number of prenatal visits for this pregnancy." The public use file includes the month prenatal care began (ranging from months 1-10 of the pregnancy based on the obstetric estimate of gestation) as well as a recode for the trimester prenatal care began (1st, 2nd, or 3rd). "Date of the last prenatal care visit" is no longer available in the public use file due to concerns with data quality.

It is recommended that prenatal care information be collected directly from the prenatal care record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for these items are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table 15** of the 2016 Final Report [1], and **Table B** for the percent of records for which month prenatal care began and number of prenatal care visits is not stated.

WIC food during pregnancy

It is recommended that information on receipt of WIC (The Special Supplemental Nutrition Program for Women, Infants, and Children) food for the mother during this pregnancy be reported

directly by the mother using the Mother's Worksheet [26]. WIC is a program intended to help low-income pregnant women, infants, and children through age 5 receive proper nutrition by providing vouchers for food, nutrition counseling, health care screenings and referrals; it is administered by the U.S. Department of Agriculture [42]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-11** of the 2016 Final Report [1], and **Table B** for the percent of records for which receipt of WIC is not stated.

Obstetric procedures

Two obstetric procedures: 1) successful external cephalic version and 2) failed external cephalic version are available in the 2016 natality public use file. The choice "None of the above" is available if external cephalic version is not applicable. If the item is not completed (i.e. none of the boxes are checked), it is classified as "Not stated." Cervical cerclage and tocolyis are no longer available in the public use file due to concerns with data quality.

It is recommended that this information on obstetric procedures be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-14** of the 2016 Final Report [1], and **Table B** for the percent of records for which obstetric procedures is not stated.

Characteristics of labor and delivery

Six characteristics of labor and delivery are separately identified in a checkbox format: 1) induction of labor; 2) augmentation of labor; 3) steroids; 4) antibiotics received by the mother during labor; 5) clinical chorioamnionitis or maternal temperature $\geq 38^{\circ}$ C; and 6) epidural or spinal anesthesia during labor. The characteristics of labor and delivery item allows for the reporting of more than one characteristic and includes a choice of "None of the above." If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated." Due to concerns with data quality, non-vertex presentation, moderate/heavy meconium staining of the amniotic fluid and fetal intolerance of labor are no longer available in the public use file.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and

computation methods [29,30], **Table I-15** of the 2016 Final Report [1], and **Table B** for the percent of records for which characteristics of labor and delivery is not stated.

Place of birth

Five options for place of birth are identified in a checkbox format: 1) hospital; 2) freestanding birth center; 3) home birth, 4) clinic/doctor's office and 5) other (must be specified). If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated".

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Tables I-4** and **I-5** of the 2016 Final Report [1], and **Table B** for the percent of records for which place of birth is not stated.

Planned home births: Information on whether the home birth was planned is reported by 49 states and the District of Columbia (excludes California), representing 87.6 percent of 2016 births. If the birth was a home birth (box checked) then the following question is asked in a checkbox format: Planned to deliver at home? Yes/No.

A reporting flag should be used to generate accurate numbers by residence for planned home births. The reporting flag (the file position is specified in the file layout) will exclude births to residents of non-reporting states (California). More information on the use of reporting flags can be found in the introduction to the User Guide for the 2014 Natality Public Use File [17].

Time of birth

Time of birth is based on a 24-hour (military) clock. It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Tables I-1** of the 2016 Final Report [1], and **Table B** for the percent of records for which time of birth is not stated.

Attendant at birth

Five options for title of attendant at birth are identified in a checkbox format: 1) MD (medical doctor) 2) DO (osteopath) 3) CNM/CM (certified nurse midwife/certified midwife) 4) other midwife 5)

other (must be specified). If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated".

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Tables I-4** of the 2016 Final Report [1], and **Table B** for the percent of records for which attendant at birth is not stated.

CNM/CM-attended births: There is evidence that the number of live births attended by CNM/CM is understated [43], largely due to difficulty in correctly identifying the birth attendant when more than one provider is present at the birth. (Anecdotal evidence suggests that some hospitals require that a physician be reported as the attendant even when no physician is physically present at midwife-attended births.)

Method of delivery

Three options for fetal presentation at birth are identified in a checkbox format: 1) cephalic; 2) breech; and 3) other. Four options for final route and method of delivery are identified in a checkbox format: 1) vaginal/spontaneous; 2) vaginal/forceps; 3) vaginal/vacuum; and 4) cesarean. If either of the two items, fetal presentation at birth and final route and method of delivery, are not completed (i.e., none of the boxes are checked), they are classified as "Not stated". The checkboxes, stating whether delivery with forceps or vacuum extraction was unsuccessful are no longer included in the public use files due to concerns with data quality.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-17** of the 2016 Final Report [1], and **Table B** for the percent of records for which fetal presentation and final route and method of delivery is not stated.

Trial of labor: If the final route and method of delivery was cesarean (box checked) then the question "If cesarean, was a trial of labor attempted?" Yes/ No is asked. See **Table I-17** of the 2016 Final Report [1].

Total cesarean rate: The overall cesarean delivery rate or total cesarean rate is computed as the percent of all births delivered by cesarean. See **Tables 17, 18,** and **I-16** of the 2016 Final Report [1].

Low-risk cesarean rate: The low-risk cesarean delivery rate is the number of singleton, term (37 or more weeks of gestation based on obstetric estimate), cephalic, cesarean deliveries to women having a first birth per 100 women delivering singleton, term, cephalic, first births. Obstetric estimate and livebirth order are discussed in more detail elsewhere. See **Tables 17** and **18** of the 2016 Final Report [1].

Primary cesarean and VBAC delivery rates: The primary cesarean and vaginal birth after previous cesarean (VBAC) delivery rates are computed by using the information on vaginal and cesarean deliveries from the "Method of delivery" item as well as information on whether the mother had a previous cesarean from the "Risk factors in this pregnancy" item. The primary cesarean rate is computed as the number of women having a first cesarean delivery divided by all women giving birth who have never had a cesarean delivery. The denominator for the primary cesarean rate includes the sum of primary cesareans and vaginal births without a previous cesarean. The rate of VBAC delivery is computed by dividing all VBAC deliveries by the sum of VBAC and repeat cesarean deliveries, that is, women with a previous cesarean delivery. See **Tables 17** and **18** of the 2016 Final Report [1].

Source of payment for the delivery

Four options for source of payment at delivery are identified in a checkbox format: 1) private insurance; 2) Medicaid; 3); self-pay; and 4) other (must be specified). If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated". The instructions are to check the box that best describes the principal source of payment for this delivery.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table 19** of the 2016 Final Report [1], and **Table B** for the percent of records for which source of payment is not stated.

More detailed information for the "other" category is available for 35 states, representing 57.2 percent of all U.S. births in 2016. For these states, the "Other" category is further delineated into the following groups: 1) Indian Health Service; 2) CHAMPUS/TRICARE; 3) Other government; and 4) other (must be specified). A reporting flag should be used to generate accurate numbers by residence for more detailed source of payment at delivery. The reporting flag (the file position is specified in the file layout) will exclude births to residents of non-reporting states (California). More information on the use of reporting flags can be found in the introduction to the User Guide for the 2014 Natality Public Use File [17].

Maternal Behavior and Health Characteristics

Mother's pre-pregnancy body mass index (BMI)

BMI provides an indication of the mother's body fat based on her height and pre-pregnancy weight (see below). Mother's height and pre-pregnancy weight are discussed in more detail below. Mother's pre-pregnancy BMI is calculated as:

[mother's pre-pregnancy weight (lb) / [mother's height (in)]2] x 703

The currently used categories for BMI were established by the National Health, Lung and Blood Institute (NHBL) in the late 1990s [44]. See the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-9** of the 2016 Final Report [1].

Mother's height

Mother's height is one of the measurements used to compute mother's pre-pregnancy BMI (see above). The range of acceptable values for this item is 1-8 feet and 1-11 inches.

It is recommended that information on the mother's height (in feet/inches) come from the Mother's Worksheet [26]. See the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Table B** for the percent of records for which mother's height is not stated.

Mother's pre-pregnancy weight

Mother's pre-pregnancy weight is one of the measurements used to compute mother's pre-pregnancy BMI (see above). Mother's pre-pregnancy weight, along with mother's weight at delivery, is used to compute the mother's weight gain during delivery (see below). The range of values accepted for mother's pre-pregnancy weight is 50-400 pounds. All other values are edited to "Not stated".

It is recommended that information on the mother's pre-pregnancy weight (in pounds) be reported directly by the mother via the <u>Mother's Worksheet</u> [26]. See the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Table B** for the percent of records for which mother's pre-pregnancy weight is not stated.

Mother's weight at delivery

Mother's weight at delivery, along with mother's pre-pregnancy weight, is used to compute the mother's weight gain during pregnancy (see below). The range of values accepted for mother's weight at delivery is 50-450 pounds.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Table B** for the percent of records for which mother's weight at delivery is not stated.

Weight gain during pregnancy

Information on weight gain during pregnancy is derived from mother's pre-pregnancy weight and mother's weight at delivery (see above). Mother's weight gain during pregnancy is calculated by subtracting the mother's pre-pregnancy weight from her weight at delivery. Weight gain during pregnancy is reported in pounds. A reported loss of weight is recorded as zero gain. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30].

Cigarette smoking before and during pregnancy

The question asks for the number of cigarettes (or packs) smoked in the three months before pregnancy and in each trimester. All entries of packs of cigarettes are converted to number of cigarettes (1 pack = 20 cigarettes). If the mother reports smoking in any of the three trimesters of pregnancy she is classified as a smoker (smoked anytime during pregnancy). Women with unknown smoking status for any trimester who report not smoking in the remaining trimesters are classified as "Unknown smoking status".

Quitting smoking before or during pregnancy: Women who report smoking in the three months prior to pregnancy but report no smoking during all three trimesters are considered to have quit smoking before pregnancy. Women who smoked in the three months prior to pregnancy and during any trimester are considered to have not quit smoking before pregnancy. If a woman reported smoking in the three months prior to pregnancy, and reported not smoking during one or more trimesters, but smoking status was unknown for any of the other trimesters, quitting before pregnancy status is classified as "Unknown". Women who report smoking only in the first trimester and/or second trimesters, but not the third trimester, are considered to have quit smoking during pregnancy. If smoking status during the third trimester of pregnancy is unknown, quitting status is tabulated as "Unknown" [30].

It is recommended that information on smoking before and during pregnancy be reported directly by the mother via the <u>Mother's Worksheet</u> [26]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table 16** of the 2016 Final Report [1], and **Table B** for the percent of records for which cigarette smoking before and during pregnancy is not stated.

Risk factors in this pregnancy

Six risk factors are separately identified in a checkbox format: 1) diabetes (pre-pregnancy or gestational); 2) hypertension (pre-pregnancy or gestational); 3) eclampsia; 4) previous preterm births; 5) pregnancy resulted from infertility treatment; and 6) mother had a previous cesarean delivery. This item allows for the reporting of more than one risk factor and includes a choice of "None of the above". If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated". The checkbox "Other previous poor pregnancy outcome" is no longer available in the public use files because of concerns with data quality.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-12** of the 2016 Final Report [1], and **Table B** for the percent of records for which risk factors is not stated.

Eclampsia: Information on eclampsia is available for 48 states and the District of Columbia (excludes South Carolina and Tennessee), representing 96.5 percent of 2016 births. A reporting flag should be used to generate accurate numbers by residence for eclampsia. The reporting flag (the file position is specified in the file layout) will exclude births to residents of non-reporting states. More information on the use of reporting flags can be found in the introduction to the User Guide for the 2014 Natality Public Use File [17].

Pregnancy resulted from infertility treatment: There is a general checkbox question about whether the pregnancy resulted from infertility treatment. If the answer is "Yes" (box checked) then the infertility treatments are grouped into two separate categories:

- Fertility enhancing drugs, artificial insemination, or intrauterine insemination
- Assisted reproductive technology (e.g., in vitro fertilization (IVF), gamete intrafallopian transfer (GIFT), ZIFT).

A total of 47 states and the District of Columbia (excludes New Hampshire, South Carolina, and Tennesee), representing 96.2 percent of 2016 births, reported information on the type of infertility

treatment used. The instructions are to check all that apply, meaning that one or both of these responses can be reported for the same birth. ART procedures are those in which both egg and sperm are handled in the laboratory.

A reporting flag should be used to generate accurate numbers by residence for type of infertility treatment used. The reporting flag (the file position is specified in the file layout) will exclude births to residents of non-reporting states. More information on the use of reporting flags can be found in the introduction to the User Guide for the 2014 Natality Public Use File [17].

Infections present and/or treated during this pregnancy

Five infections are separately identified in a checkbox format: 1) gonorrhea; 2) syphilis; 3) chlamydia; 4) hepatitis B; and 5) hepatitis C. This is a checkbox item allowing for the reporting of more than one infection and includes a choice of "None of the above". If the item is not completed (i.e. none of the boxes are checked), it is classified as "Not stated".

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-13** of the 2016 Final Report [1], and **Table B** for the percent of records for which infections present and/or treated during this pregnancy is not stated.

Maternal morbidity

Five maternal morbidities are separately identified in a checkbox format: 1) maternal transfusion; 2) third or fourth degree perineal laceration; 3) ruptured uterus; 4) unplanned hysterectomy; and 5) admission to intensive care unit. This item allows for the reporting of more than one morbidity and includes a choice of "None of the above". If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated". The checkbox item "unplanned operating room procedure following delivery" is no longer included in the public use file because of concerns with data quality.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-18** of the 2016 Final Report [1], and **Table B** for the percent of records for which maternal morbidities is not stated.

Infant Health Characteristics

Period of gestation

Beginning with the 2014 data year, NCHS transitioned to a new standard for estimating the gestational age of the newborn. The new measure – the obstetric estimate of gestation at delivery (OE) replaces the measure based on the data of the last normal menses (LMP) [45]. Accordingly, gestational age data in standard reports are based on the OE. However, LMP-based data are also available. National data based on the OE are available only from data year 2007 forward. Gestational age estimates differ somewhat between the OE- and LMP-based measures. For example, the 2016 OE-based preterm birth rate is 9.84% compared with the LMP-based rate of 11.40%. Of note, both preterm birth rates declined from 2007 to 2014 but rose from 2015 to 2016. Information discussion of the reasons for the change, and a detailed comparison of the two measures, are presented elsewhere [45].

Births occurring before 37 completed weeks of gestation are considered to be preterm for purposes of classification consistent with the ICD-9 and ICD-10 definitions [13]. NCHS further categorizes births at less than 34 weeks as early preterm and births at 34-36 weeks as late preterm. Births occurring between 37 and 38 completed weeks are considered early term, between 39 and 40 completed weeks as full term, 41 completed weeks as late term, and at 42 completed weeks and over as post-term. These distinctions are consistent with the revised American College of Obstetrics and Gynecology revised term definitions [46].

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Tables 20, 21, I-19**, and **I-20** of the 2016 Final Report [1], and **Table B** for the percent of records for which period of gestation is not stated.

Birthweight

Birthweight is reported in some areas in pounds and ounces and in other areas as grams. However, the metric system is used to tabulate and present the statistics to facilitate comparison with data published by other groups. The categories for birthweight are consistent with the recommendations in the International Statistical Classification of Diseases, Ninth Revision (ICD–9) and the International Statistical Classification of Diseases, Tenth Revision (ICD–10) [13,47]. The categories in gram intervals and their equivalents in pounds and ounces are as follows:

```
Less than 500 grams = 1 lb 1 oz or less

500–999 grams = 1 lb 2 oz–2 lb 3 oz

1,000–1,499 grams = 2 lb 4 oz–3 lb 4 oz

1,500–1,999 grams = 3 lb 5 oz–4 lb 6 oz

2,000–2,499 grams = 4 lb 7 oz–5 lb 8 oz

2,500–2,999 grams = 5 lb 9 oz–6 lb 9 oz

3,000–3,499 grams = 6 lb 10 oz–7 lb 11 oz

3,500–3,999 grams = 7 lb 12 oz–8 lb 13 oz

4,000–4,499 grams = 8 lb 14 oz–9 lb 14 oz

4,500–4,999 grams = 9 lb 15 oz–11 lb 0 oz

5,000 grams or more = 11 lb 1 oz or more
```

ICD-9 and ICD-10 define low birthweight as less than 2,500 grams. Very low birthweight is defined as less than 1,500 grams.

To establish the continuity of class intervals needed to convert pounds and ounces to grams, the end points of these intervals are assumed to be half an ounce less at the lower end and half an ounce more at the upper end. For example, 2 lb 4 oz–3 lb 4 oz is interpreted as 2 lb 3 ½ oz–3 lb 4 ½ oz.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Tables 22**, **23**, **I-21**, and **I-22** of the 2016 Final Report [1], and **Table B** for the percent of records for which birthweight is not stated.

Apgar score

5-minute score: The Apgar score is a measure of the need for resuscitation and a predictor of the infant's chances of surviving the first year of life. It is a summary measure of the infant's condition based on heart rate, respiratory effort, muscle tone, reflex irritability, and color. Each of these factors is given a score of 0, 1, or 2; the sum of these 5 values is the Apgar score, which ranges from 0 to 10. A score of 0 to 3 indicates an infant in need of resuscitation; a score of 4 to 6 is considered intermediate; a score of 7 or greater indicates that the neonate is in good to excellent physical condition. The 5-minute score means that these factors were assessed at 5 minutes after delivery.

10-minute Apgar score: The 2003 revised certificate asks for a 10-minute Apgar score if the 5-minute score is less than 6. Ten-minute Apgar score was reported for 1.2 percent (46,852) of births in 2016; an additional 5.5 percent (2,713) of births had "Not stated" 10-minute Apgar score for infants whose 5-minute score was less than 6.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30] and **Table B** for the percent of records for which 5-minute and 10-minute Apgar score is not stated.

Abnormal conditions of the newborn

Six abnormal conditions of the newborn are separately identified in a checkbox format: 1) assisted ventilation required immediately following delivery; 2) assisted ventilation required for more than six hours; 3) NICU admission; 4) newborn given surfactant replacement therapy; 5) antibiotics received by the newborn for suspected neonatal sepsis; and 6) seizure or serious neurological dysfunction. This item allows for the reporting of more than one condition and includes a choice of "None of the above". If the item is not completed (i.e., none of the boxes are checked), it is classified as "Not stated". The checkbox item significant birth injury is no longer included in the public use file because of concerns with data quality.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-24** of the 2016 Final Report [1], and **Table B** for the percent of records for which abnormal conditions of the newborn is not stated.

Congenital anomalies of the newborn

Twelve congenital anomalies are separately identified in a checkbox format: 1) anencephaly; 2) meningomyelocele/spina bifida; 3) cyanotic congenital heart disease; 4) congenital diaphragmatic hernia; 5) omphalocele; 6) gastrochisis; 7) limb reduction defect; 8) cleft lip with or without cleft palate; 9) cleft palate alone; 10) Down syndrome; 11) suspected chromosomal disorder; and 12) hypospadias. This item allows for the reporting of more than one anomaly and includes a choice of "None of the above". If the item is not completed (i.e. none of the boxes are checked), it is classified as "Not stated".

Data for the congenital anomaly "Hypospadias" are edited to exclude this condition where the infant is a female.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the

<u>Guide to the Facility Worksheet</u> [28]. See also the NCHS manual for detailed descriptions of editing and computation methods [29,30], **Table I-25** of the 2016 Final Report [1], and **Table B** for the percent of records for which congenital anomalies is not stated. See the Quality of Data section below for discuss of quality concerns with rarely occurring events.

Down Syndrome and suspected chromosomal disorder: The item includes a general checkbox question about whether Down Syndrome and suspected chromosomal disorder are present. If "Yes" (box checked), the following question is asked: karyotype pending or karyotype confirmed. These responses are combined for a "Yes" response.

Plurality

Plurality is classified as single, twin, triplet, quadruplet, and quintuplet and higher order births. Each record in the public use natality file represents an individual birth. For example, a record coded as a twin represents one birth in a twin delivery. Pairs or sets of twins or higher order multiple births are not identified in this file. Records for which plurality is unknown are imputed as singletons. This occurred for 0.007% (269) of all records for 2016.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also NCHS manuals for detailed descriptions of editing and computation methods [29,30], **Tables 24**, **25**, and **I-23** in the 2016 Final Report [1].

Infant breastfed

Information on whether the infant was being breastfed during the period from birth to discharge from the hospital is available 48 states and the District of Columbia (excludes California and Michigan), representing 84.7 percent of all U.S. births in 2016. The item asks the question: Is the infant being breastfed at discharge? Yes/No. The intent to breastfeed, without having initiated it by the time of hospital discharge, is not considered a "Yes" response.

It is recommended that this information be collected directly from the medical record using the <u>Facility Worksheet</u> [27]. Detailed instructions and definitions for the characteristics are presented in the <u>Guide to the Facility Worksheet</u> [28]. See also NCHS manuals for detailed descriptions of editing and computation methods [29,30], **Table I-11** in the 2016 Final Report [1], and **Table B** for the percent of records for which infant breastfed at discharge is not stated.

A reporting flag should be used to generate accurate numbers by residence for infant breastfed. The reporting flag (the file position is specified in the file layout) will exclude births to residents of nonreporting states. More information on the use of reporting flags can be found in the introduction to the User Guide for the 2014 Natality Public Use File [17].

Definitions of medical terms

For definitions and discussion of the maternal and infant health characteristics, see the <u>Guide to</u> the <u>Facility Worksheet</u> [26].

Quality of Data

Although vital statistics data are useful for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless various qualifying factors and methods of classification are taken into account. The factors to be considered depend on the specific purposes for which the data are to be used. It is not feasible to discuss all the pertinent factors in the use of vital statistics tabulations, but some of the more important ones should be mentioned.

Most of the factors limiting the use of data arise from imperfections (missing or misclassified) in the original records or from the impracticability of tabulating these data in very detailed categories. These limitations should not be ignored, but their existence does not lessen the value of the data for most general purposes.

Completeness of registration: It is estimated that more than 99 percent of all births occurring in the United States in 2016 were registered.

Completeness of reporting: Interpretation of birth certificate data must include evaluation of item completeness. The "Not stated" percentage is one measure of the quality of the data. Completeness of reporting varies among items and states. See **Table B** for the percentage of birth records on which specified items were not stated. Items with high percentages of "Not stated" should be interpreted with caution.

Quality control procedures: As electronic files are received at NCHS, they are automatically checked for completeness, individual item code validity, and unacceptable inconsistencies between data items. The registration area is notified of any problems. In addition, NCHS staff review the files on an ongoing basis to detect problems in overall quality such as inadequate reporting for certain items, failure to follow NCHS coding rules, and systems and software errors. Traditionally, quality assurance procedures were limited to the review and analysis of differences between NCHS and registration area code assignments for a small sample of records. As electronic birth registration became prevalent, this procedure was augmented by analyses of year-to-year and area-to-area variations in the data. These

analyses are based on preliminary tabulations of the data that are cumulated by state on a year-to-date basis. NCHS investigates all differences judged to have consequences for quality and completeness. In the review process, statistical tests are used to call initial attention to differences for possible follow-up. As necessary, registration areas are informed of differences encountered in the tables and asked to verify the counts or to determine the nature of the differences. Missing records (except those permanently voided) and other problems detected by NCHS are resolved, and corrections are transmitted to NCHS.

Comparison with medical records: A 2013 report based on studies in two states showed that the quality of data items on the 2003 revised birth certificate varied widely. That is, some items are collected in such a manner that exact agreement with the medical records (considered the "gold standard") for non-check box items and sensitivity for checkbox items was high, whereas some health and medical condition items on the birth certificate are likely underreported [8].

Rarely occurring events: There were not enough cases of some of the rarer conditions listed on the birth certificate to assess data quality in the study above. Examples are maternal morbidities, such as ruptured uterus and unplanned hysterectomy. These may be underreported on the birth certificate compared with results from large multi-center studies and nationally representative survey data. For example, the rate of uterine rupture for women with a previous cesarean who delivered singletons at term (37 or more weeks of completed gestation) was 0.32% in 1999-2002 in a National Institute for Child Health and Development (NICHD) 19-institution cohort study [48] compared with 0.08 percent for comparable birth certificate data in 2014. Although there are other reasons for the differences in the rates, such as the differing time periods under study, these findings suggest that the birth certificate data likely underreport these morbidities.

It is well documented that congenital anomalies, except for the most visible and most severe, have historically been under-reported on birth certificates [49]. This has been attributable, at least in part, to the inclusion of anomalies on the 1989 U.S. Standard Certificate of Live Birth, which may be difficult to detect within the short period between birth and completion of the child's birth certificate. The 2003 revision of the U.S. Standard Certificate attempted to improve reporting of congenital anomalies by including only those diagnosable within 24 hours of birth using conventional, widely available diagnostic techniques [50]. However, it is not clear whether these efforts were successful because the instances of the anomalies were too few to be included in the quality study above and there have yet to be other quality studies assessing these data.

State-specific data quality issues for 2016

These state-specific data quality issues are of particular concern due to underreporting and/or inaccurate reporting for 2016. *These data should be used with caution*.

Hawaii:

• Characteristics of Labor & Delivery - Steroids

Louisiana:

• Abnormal conditions of the newborn – All checkbox items

Michigan:

• *Breastfeeding* – Item wording is not consistent with the national standard item wording and data for this state are not considered comparable with those of other states. Use the reporting flag for this item to exclude Michigan data from the reporting area totals.

New Mexico:

- **Risk Factors** Previous preterm birth
- Characteristics of Labor & Delivery Steroids for fetal lung maturation received by mother
- Characteristics of Labor & Delivery Antibiotics received by mother during labor
- *Infections present and/or treated during this pregnancy* All checkbox items
- Obstetric procedures Successful external cephalic version

North Carolina:

- *Abnormal conditions of the newborn* Assisted ventilation immediately following delivery Oklahoma:
 - *Abnormal conditions of the newborn* Assisted ventilation immediately following delivery, Assisted ventilation for more than 6 hours

Puerto Rico:

• Characteristics of Labor & Delivery – Anesthesia, Induction of labor

Rhode Island:

- Mother's education
- **Prenatal care items** Number of prenatal care visits
- Date of last normal menses

Virginia:

- **Prenatal care items** Number prenatal care visits
- Pregnancy risk factors All checkbox items except Eclampsia, Previous cesarean delivery
- *Obstetric procedures* Successful, Failed External cephalic version

- Characteristics of labor & delivery All checkbox items
- *Maternal morbidities* All checkbox items
- *Abnormal conditions* All checkbox items

U.S. Virgin Islands: Several data items for the U.S. Virgin Islands had high not stated values, and these data should be used with caution. See **Table B**.

Computation of Rates and Other Measures

Population denominators

2016 population estimates: Birth and fertility rates for 2016 shown in the 2016 Final Report [1] are based on populations estimated from the 2010 census as of July 1, 2016. These populations are shown in **Table 1** and include both unbridged-race and bridged-race population estimates. The population estimates have been provided by the U.S. Census Bureau [51,52] and are based on the 2010 census counts by age, race, and sex. For the unbridged population estimates, the racial categories are consistent with the revised 1997 OMB standards [33]. For the bridged-race estimates, the populations have been modified so that the racial categories are consistent with 1977 OMB standards [37]. The modification procedures are described in detail elsewhere [34].

Birth and fertility rates by state shown in the 2016 Final Report [1] are based on state-level population counts based on the 2010 census provided by the U.S. Census Bureau [52]. Birth and fertility rates for the territories except Puerto Rico are based on population estimates provided by the U.S. Census Bureau's International Data Base [53]. Rates for Puerto Rico are based on population estimates from the 2010 census as of July 1, 2016, and are provided by the U.S. Census Bureau [54].

Rates by state and territory shown in this report may differ from rates computed on the basis of other population estimates; rates for smaller population subgroups such as those for teen mothers may be particularly affected by differences in population estimates. Birth and fertility rates by month are based on monthly population estimates also based on the 2010 census estimates. Rates for unmarried women are based on distributions of the population by marital status averaged over a 2-year period for 2015–2016 as reported by the U.S. Census Bureau in the March Current Population Survey (CPS) for each year [55-56], which have been adjusted to July 1, 2016 (2010 census), population levels [51,52] by NCHS' Division of Vital Statistics [40].

As of the preparation of this report, data from the March CPS for 2017 were not available. Accordingly, the distributions of the population by marital status were based on a 2-year average of

2015 and 2016. For earlier years, rates for unmarried women are based on distributions of the population by marital status averaged over a 3-year period.

Population estimates for the specific Hispanic groups

Beginning in 2011, birth and fertility rates for the specific Hispanic population groups (Mexican, Puerto Rican, Cuban, Central and South American, and Other Hispanic populations) are based on population estimates derived from the 1-year American Community Survey (ACS) [57] and adjusted to the U.S. resident population control totals by the U.S. Census Bureau. Rates for the specific Hispanic population groups prior to 2010 were based on population estimates derived from the Current Population Survey (CPS) and adjusted to the U.S. resident population control totals by the U.S. Census Bureau and/or NCHS' Division of Vital Statistics. The change to the ACS-based rates was made because ACS estimates are more statistically reliable and represent the entire United States population. ACS estimates are based on an approximately 3 million annual sample of the U.S. population, including all households (civilian and military) and the institutionalized population (persons living in group quarters) [58]. CPS estimates are based on an approximate 200,000 sample of only the civilian, non-institutionalized U.S. population [59]. The larger ACS sample allows the possibility to show rates in more detail than in previous years, especially for Cuban and Puerto Rican women. The 2016 population estimates for the specific Hispanic population groups were not available as of the preparation of the 2016 final report. Accordingly, birth and fertility rates for these groups are not shown in this report. Birth and fertility rates for the specified Hispanic population groups will be available in forthcoming expanded report tables of the 2016 Final Report [1], available from:

http://www.cdc.gov/nchs/data/nvsr/nvsr64_13_expandedtables.pdf. The 2016 specific population estimates for Hispanic groups will be presented in an expanded **Table 1**, available from:
http://www.cdc.gov/nchs/data/nvsr/nvsr64_13_expanded_tables.pdf. These estimates will be derived from the 2016 1-year ACS and adjusted according to the (2010-based) postcensal estimates for July 1, 2016.

Revised population estimates

Residential population base: Birth rates for the United States and individual states are based on the total resident populations of the respective areas (**Table 2**). These populations exclude the Armed Forces abroad but include the Armed Forces stationed in each area. The residential population of the birth- and death-registration states for 1900–1932 and for the United States for 1900–2016 is shown in

Table 3. In addition, the population including Armed Forces abroad is shown for the United States. A detailed discussion of historical population bases is presented elsewhere [60].

Small populations as denominators: An asterisk (*) is shown in place of any derived rate in the following situations: 1) the rate is based on fewer than 20 births in the numerator, or 2) for the Hispanic subgroups, a relative standard error of 23 percent or more for the ACS-based rates of 2010-2016. Rates based on populations below these minimum levels lack sufficient reliability for analytic purposes.

Net census undercounts and overcounts: Studies conducted by the U.S. Census Bureau indicate that some age, race, and sex groups are more completely enumerated than others. Census miscounts can have consequences for vital statistics measures. For example, an adjustment to increase the population denominator would result in a smaller rate compared to the unadjusted population. A more detailed discussion of census undercounts and overcounts can be found in the "1999 Technical Appendix" [60]. Adjusted rates for 2016 can be computed by multiplying the reported rates by ratios from the 2016 census-level population adjusted for the estimated age-specific census over- and undercounts.

Cohort fertility tables

Various fertility measures for cohorts of women are computed from births adjusted for underregistration and population estimates corrected for under enumeration and misstatement of age. Cohort fertility tables are available through 2009 and have recently been revised and updated to incorporate new rates for black women [61-64]. A detailed description of the methods used in deriving these measures is available in an earlier publication as well as detailed data for earlier years [65].

Total fertility rates

The total fertility rate is the sum of the birth rates by age of mother (in 5-year age groups) multiplied by 5. It is an age-adjusted rate because it is based on the assumption that there is the same number of women in each age group. The rate of 1,820.5 in 2016, for example, means that if a hypothetical group of 1,000 women were to have the same birth rates in each age group that were observed in the actual childbearing population in 2016, they would have a total of 1,820.5 children by the time they reached the end of the reproductive period (taken here to be age 50 years), assuming that all of the women survived to that age.

Seasonal adjustment of rates

The seasonally adjusted birth and fertility rates are computed from the X–11 variant of Census Method II [66]. This method, used since 1964, differs slightly from the U.S. Bureau of Labor Statistics (BLS) Seasonal Factor Method, which was used for *Vital Statistics of the United States*, 1964. The fundamental technique is the same in that it is an adaptation of the ratio-to-moving-average method. Before 1964, the method of seasonal adjustment was based on the X–9 variant and other variants of Census Method II. A comparison of the Census Method II with the BLS Seasonal Factor Method shows the differences in the seasonal patterns of births to be negligible.

Computation of percentages, percentage distributions, and means

Births for which a particular characteristic is unknown were subtracted from the figures for total births that were used as denominators before percentages, percentage distributions, and means were computed. The percentage of records with missing information for each item is shown by state in **Table**B. The mean age of mother is the arithmetic average of the age of mothers at the time of birth, computed directly from the frequency of births by age of mother. An asterisk is shown in place of any derived statistic based on fewer than 20 births in the numerator.

Computation of Measures of Variability

Random variation and significance testing for natality data

For information and discussion on random variation and significance testing for natality data, with the exception of specified Hispanic groups (see below), see the User Guide to the 2010 Natality Public Use File [67].

Specified Hispanic population groups

Birth and fertility rates for Mexican, Puerto Rican, Cuban, Central and Other Hispanic populations are based on population estimates derived from the ACS [57,58] for 2016 and adjusted to resident population control totals. As a result, the rates are subject to sampling variability in the denominator as well as random variability in the numerator [68].

The standard error for birth and fertility rates (SE(R)) is calculated as:

1.
$$SE(R) = R\sqrt{\frac{1}{B} + \left(\frac{SE(P)}{P}\right)^2}$$

where R denotes the fertility or birth rate, B the number of births, SE(P) the standard errors of the ACS population estimates, P. The standard errors of ACS population estimates to be used in the 2016 Final Report will be presented in Table 1 with the population estimates by Mexican, Puerto Rican, Cuban, and Other Hispanic when these estimates become available (see Population estimates for specific Hispanic groups).

When the number of births is large, a normal approximation may be used in calculating confidence intervals and statistical tests. In general, for birth and fertility rates, the normal approximation performs well when the number of births is 100 or greater. Formula 2 is used to calculate 95 percent confidence limits for the birth or fertility rate when the normal approximation is appropriate:

2.
$$L(R) = R - 1.96(SE(R))$$
 and $U(R) = R + 1.96(SE(R))$

Or, substituting the relative standard error terms in formula 2,

3.
$$L(R) = R - 1.96 \left(R \sqrt{\frac{1}{B} + \left(\frac{SE(P)}{P} \right)^2} \right) \text{ and } U(R) = R + 1.96 \left(R \sqrt{\frac{1}{B} + \left(\frac{SE(P)}{P} \right)^2} \right)$$

where L(R) and U(R) are the lower and upper limits of the confidence interval, respectively. The resulting 95 percent confidence interval can be interpreted to mean that the chances are 95 in 100 that the "true" birth or fertility rate falls between L(R) and U(R).

For example, suppose that the general fertility rate for Mexican women is 76.8 per 1,000 women age 15-44 (based on 587,429 births and a population of 7,648,815 women). The standard error of the ACS population estimate is 293,528. Lower and upper 95 percent confidence limits using Formula 3 are calculated as:

$$L(76.8) = 76.8 - 1.96(2.949) = 71.0$$
 and $U(76.8) = 76.8 + 1.96(2.949) = 82.6$

Thus, the chances are 95 in 100 that the true fertility rate for Mexican women is between 71.0 and 82.6.

When testing the difference between two rates, R_1 and R_2 (each based on 100 or more births), the normal approximation may be used to calculate a test statistic, z, such that:

4.
$$z = \frac{R_1 - R_2}{\sqrt{SE(R_1)^2 + SE(R_2)^2}}$$

Or, substituting the relative standard error terms in formula 4,

5.
$$z = \frac{R_1 - R_2}{\sqrt{\left(R_1^2 \times \left(\frac{1}{B_1} + \left(\frac{SE(P_1)}{P_1}\right)^2\right)\right) + \left(R_2^2 \times \left(\frac{1}{B_2} + \left(\frac{SE(P_2)}{P_2}\right)^2\right)\right)}}$$

If $|z| \ge 1.96$, then the difference between the rates is statistically significant at the 0.05 level. If |z| < 1.96, then the difference is not statistically significant.

For example, suppose that the general fertility rate for Mexican women is 79.2 per 1,000 women age 15-44 (based on 599,417 births and a population of 7,568,396 women) in the previous data year $(R_{_{\it I}})$ and 76.8 in the current data year $(R_{_{\it I}})$ (based on 587,429 births and a population of 7,648,815 women). The standard errors of the ACS population estimates are 293,475 and 293,528, respectively. A test using Formula 5 can determine if the decrease in the general fertility rate is statistically significant:

$$z = \frac{79.2 - 76.8}{\sqrt{9.442 + 8.696}} = 0.56$$

Because z = 0.56 < 1.96, the change from the previous data year to the current data year in the general fertility rate for Mexican women is not statistically significant.

^{0.0} Quantity more than zero but less than 0.05.

⁻⁻⁻Data not available.

⁻ Quantity zero.

 $^{^{1}}$ Excludes data for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas.

 $^{^{2}}$ American Samoa has not yet adopted the 2003 U.S. Standard Certificate of Live Birth.

 $^{^3}$ Expanded source of payment categories reported by 37 states; see "Detailed technical notes".

⁴ California and Michigan do not report infant breastfed. See "Detailed technical notes."

⁻⁻⁻ Data not available.

NOTES: Population count estimates are based on the 2010 census; see "Technical Notes." Population estimates for Mexican, Puerto Rican, Cuban, Central and Other Hispanic, which includes includes Central and South American and other and unknown Hispanic, are based on the American Community Survey adjusted to resident population control totals (the 2010-based population estimates for the United States for July 1, 2016). Population estimates for Hispanic total are based on the 2010 census, as of Juy 1, 2016. Population estimates by specified Hispanic origin in this table may not add to population estimates for total Hispanic. Standard errors are shown in parentheses below each population estimates.

SOURCE: U.S. Census Bureau. See references 51, 52, and 57.

¹ Single-race is defined as only one race reported. Race categories are consistent with the 1997 Office of Management and Budget (OMB) standards.

² Persons of non-Hispanic origin may be of any race.

³ Bridged-race is defined as that multiple-race data imputed to the single-race categories of the 1977 OMB standards.

⁴ Includes all persons of Hispanic origin of any race.

⁵ Includes Central and South American and other and unknown Hispanic.

 ${\tt NOTE:}\ {\tt Race}\ {\tt categories}\ {\tt are}\ {\tt consistent}\ {\tt with}\ {\tt the}\ {\tt 1997}\ {\tt Office}\ {\tt of}\ {\tt Management}\ {\tt and}\ {\tt Budget}\ {\tt standards.}$

 $[\]star$ Figure does not meet standards of reliability or precision: based on fewer than 20 births in the numerator.

^{\1} Includes births to race and origin groups not shown separately, such as Hispanic, single-race white, Hispanic, single-race black, and non-Hispanic, multiple-race women, and births with origin not stated.

 $[\]$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. In this table, non-Hispanic women are classified by race. Race categories are consistent with the 1997 Office of Management and Budget standards.
