PREFACE

This book contains documentation for the SIPP 1984 Panel Wave 9 Core and Topical Module Research File.

This file was developed from responses obtained from Wave 9 of the 1984 Panel of the Survey of Income and Program Participation (SIPP). For the most part, the file follows the questionnaire instrument used in the survey. The file has two major parts. The first part relates to a core set of questions relating the demographic, social, and economic characteristics of the population. These core questions are asked of the respondents in each of the nine waves in the 1984 Panel. The second major portion of the file contains responses to questions relating to a topic (topical module) are either asked once or periodically throughout the panel, but the same questions are not asked in each wave as is the case with the core questions.

For Wave 9, three topical modules were used. The first is a battery of questions relating to annual income of the respondents. (Monthly and 4-month summary questions relating to the income of the respondent are asked as part of the core items for each wave.) The second contains information on taxes paid to various governmental units by the respondent. And, the third topical module relates to school enrollment and financing.

Because of the relatively large nonresponse rates for selected topical module items and the lack of correspondence with data from administrative sources for other items, this file is being issued as a research file. The main objective of this file is to provide a database for research and evaluation of the SIPP data--especially those covered in the topical modules--with emphasis on how these data might be useful in the future.

It must be emphasized that the major purpose in releasing this file is for research and evaluation. All estimates derived from the topical module portions of this file must be considered preliminary, unofficial, and subject to revision, which may be extensive in some areas. The Bureau will continue to examine these data and, when appropriate, make corrections and improvements to the computer processing involved in editing these items.

The Census Bureau asks that data source and its limitations be identified in any report using data from this file by including the following paragraph in any such report.

"This report uses data from the Survey of Income and Program Participation 1984 Panel (Preliminary) Wave 9 Core Plus Topical Module File, which was released by the Census Bureau for research to improve understanding and analysis of SIPP data. The data on the file are preliminary and should be analyzed and interpreted with caution. At the time the file was created, the Census Bureau was still exploring certain unresolved technical and methodological issues associated with the creation of this data set. The Census Bureau does not approve or endorse the use of these data for official estimates."

AUTHORIZATION FORM

AUTHORIZATION FOR ACCESS TO THE SURVEY OF INCOME AND PROGRAM
PARTICIPATION (SIPP) PRELIMINARY WAVE 9 CORE PLUS TOPICAL MODULE
RESTRICTED ACCESS PUBLIC-USE MICRODATA FILE

The Census Bureau has released this preliminary Wave 9 core plus topical module extract file for research to improve understanding and analysis of SIPP data. The file contains both Wave 9 core data and the Wave 9 topical modules. Only the topical module relating to education has been subjected to routine Bureau edits and imputation. The other topical modules have not been edited nor imputed although they have been topcoded or bottomcoded and recoded where necessary, to avoid disclosure of individual respondents. We expect the results of research using the file will lead to improvements in the quality of SIPP data and future products.

The Wave 9 topical module data contained on this file are preliminary and review of the data for consistency and accuracy is currently ongoing at the Census Bureau. For these reasons, the Census Bureau regards the data on the file as preliminary and not for citation as official estimates.

Users (recipients) may have access to this file under the following conditions:

1. The recipient agrees not to release the file or copies thereof to anyone else and must take adequate security measures to prevent access by individuals not authorized to receive these data.
2. The recipient agrees to share research results pertaining to the quality of the file or the data with the Census Bureau. A copy of any report prepared using data from the research file will be sent to the Census Bureau.
3. The recipient agrees to identify the data source and its limitations in any report using data from this file by including the following paragraph in any such report.

"This report uses data from the Survey of Income and Program Participation 1984 Panel (Preliminary) Wave 9 Core plus Topical Module File, which was released by the Census Bureau for research to improve understanding and analysis of SIPP data. WAVE 9 1984 PANEL
CORE PLUS TOPICAL MODULE RESEARCH FILE
CODEBOOK

This document describes the Wave 9 Core Plus Topical Module File from the 1984 Panel of the Survey of Income and Program Participation (SIPP). This file is being issued as a limited access public-use research file because the contents of the topical module portions of the file are considered to be preliminary by the Bureau of the Census and require further evaluation and testing before being used in detailed analyses. Accordingly, the file is being released only to those users who have signed a limited access agreement with the Census Bureau. To obtain a copy of the limited access agreement, potential users should write to:

Mr. Roger A. Herrlot
Senior Demographic and
Housing Analyst
Office of the Director
U.S. Bureau of the Census
Washington, D.C. 20233

or call the author of this document at the telephone number shown on the front cover.

The 1984 SIPP Wave 9 Core Plus Topical Module package is contained on two IBM compatible 9-track, 6250 bpi tapes in the EBCDIC language with or without standard labels. The tapes contain two files. The first file is the data file and consists of 41,807 records. These are rectangular (flat) records -- one for each person included in Wave 9 of the 1984 Panel. Each record contains 5636 characters of information which are described in this codebook. The second file is a machine readable version of this codebook. Each record on the second file is 80 characters in length.

This codebook is not intended as a "stand alone" document, but should be used in conjunction with the other materials that accompany the distribution of the file. Users are cautioned to carefully read the auxiliary materials to find out more about known problems and other caveats associated with the data on this file.

Item	Description	Field
SUSEQNLBR	Sequence number of sample unit. Primary sort key. (1,32000)	1-5
SU-ID	Sample Unit Identifier. This identifier is created by scrambling together the PSU, segment and serial of the original sample address. It may be used in matching Sample Units from different waves. (0,999999999)	6-14
SU-RDT	Rotation. (1,4)	15
SU-HHGMT	Number of households in sample each month. (5) (1,30)	16-25
SU-TOTHH	Total number of households (address id's) in the Sample Unit. (1,30)	26-27
SU-TOTFF	Total number of families and pseudo families in the Sample Unit. A pseudo family is an individual who is not related to anyone else in the household in which he lives. It may be a person who lives alone. Family information for a pseudo family is shown in the family sections of the persons record. (0,60)	28-29
SU-TOTPP	Total number of person records for this Sample Unit. (0,60)	30-31
SU-TOTWS	Total number of wages of Salaried businesses reported for members of the Sample Unit. Each person in the Sample Unit may report up to two wages on Salaried businesses. (0,30)	32-33

SU-TOTSE	Total number of Self-Employment Businesses reported for members of the Sample Unit. Each person in the Sample Unit may report up to two self employment businesses. (0, 20)	34-35
SU-TOTG2	Total number of persons in the Sample Unit who receive some sort of income as the result of ownership of some asset(s). (0, 30)	36-37

SU-STATE

(11, 21)
Flgs state code for the Sample Unit.

- 01 = Alabama.
- 04 = Arizona.
- 05 = Arkansas.
- 06 = California.
- 08 = Colorado.
- 09 = Connecticut.

- 55 = Wisconsin.
- 60 = Idaho, New Mexico, South Dakota, or Wyoming.
- 81 = Mississippi or West Virginia.

SU-RGC	40-42	Reduction group code established to make it possible to easily reduce sample size if necessary, from master segment tape. Not applicable for coverage improvement frame.
H1-ADDID	43-44	Address ID - This field differentiates households within the same PSU, segment and series, that is, households which originate out of an original sample household.
H1-MONTH	45-46	Month for which this household is defined.
H1-YEAR	47-48	Year for which this household is defined.
H1-NF	49-50	Number of families and pseudo families in this household in month 1.
H1-FFONT	51-52	Count of number of family groups (excluding related subfamilies) for this household in month 1.
H1-SSONT	53-54	Count of number of related subfamily groups for this household in month 1.
H1REFPER	55-59	Entry Address ID and person number of the household reference person for first month of the reference period.
H1-NP	60-61	Number of persons in household in first month of the reference period.
H1-MIS	62	Monthly household interview status. 1 = Interview. 2 = Non-Interview. 3 = Not in sample.

63-64

H1-INT1

- (0:22)
 Have 1 household interview status.
 0 = Not a Wave 1 household.
 1 = Interviewed.
 2 = Type A noninterview.
 3 = No one home.
 4 = Temporarily absent.
 5 = Refused.
 6 = Unable to locate.
 7 = Other.
 Type B noninterview.
 9 = Vacant.
 10 = Occupied by persons with use.
 11 = Unfit or to be demolished.
 12 = Under construction, not ready.
 13 = Converted to temporary business or storage.
 14 = Unoccupied tent or trailer site.
 15 = Permit granted, construction not started.
 16 = Other type B.
 Type C noninterview.
 17 = Demolished.
 18 = House or trailer moved.
 19 = Converted to permanent business or storage.
 20 = Merged.
 21 = Condemned.
 22 = Other.

H-CHANGE (1,5) 2220-2224

(5)
These fields may be used to determine if the household in which this person lived changed composition over the 4 reference months or in the 5th month up until date of interview. A change in address is not reflected in this field unless the composition of the group living together changes, as a result the first field is always 1 for each succeeding month the value of the field is the same as for the preceding month if there has been no change in composition. If a change has occurred the field for the following month is one greater than the field for the preceding month.

F-CHANGE (1,4) 2225-2228

(4)
These fields may be used to determine if the family for pseudo family) has changed in composition from one month to the next. These fields only relate to primary and unrelated sub-families and to primary and secondary individuals. To determine change in related sub-families see F-Change D below. The values of the fields for the respective months are determined in the same manner as for 'h-change' above.

S-CHANGE (0,4) 2229-2232

(4)
These fields may be used to determine if the related sub-family which includes this person, has changed composition from month to month. If, during any month, the person is not a member of a related sub-family, the value of the field for the corresponding month is '0'. For members of sub-families the values in the fields are derived as in 'h-change' above. aggregate.

SURVEY OF INCOME AND
PROGRAM PARTICIPATION (SIPP)
1984 Panel Wave 6 and 9 Research Files
(Core plus Topical Modules)

SOURCE AND RELIABILITY STATEMENT:

ENCLOSURE 5

SOURCE AND RELIABILITY STATEMENT FOR THE
SURVEY OF INCOME PROGRAM PARTICIPATION (SIPP)
WAVE 6 AND WAVE 9 MICRODATA RESEARCH FILES

SOURCE OF DATA

The data were collected in either the sixth or ninth interview wave of the 1984 panel of the Survey of Income and Program Participation (SIPP). The SIPP universe is the noninstitutionalized

resident population living in the United States. This population includes persons living in group quarters, such as dormitories, rooming houses, and religious group dwellings. Crew members of merchant vessels, Armed Forces personnel living in military barracks, and institutionalized persons, such as correctional facility inmates and nursing home residents, were not eligible to be in the survey. Similarly, United States citizens residing abroad were not eligible to be in the survey. Foreign visitors who work or attend school in this country and their families were eligible; all others were not eligible. With the exceptions noted above, persons who were at least 15 years of age at the time of the interview were eligible to be in the survey.

The 1984 panel SIPP sample is located in 174 areas comprising 450 counties (including one partial county) and independent cities. Within these areas, clusters of 2 to 4 living quarters (LQs) were systematically selected from lists of addresses prepared for the 1970 decennial census to form the bulk of the sample. To account for LQs built within each of the sample areas after the 1970 census, a sample was drawn of permits issued for construction of residential LQs through March 1983. In jurisdictions

tions that do not issue building permits, small land areas were sampled and the LAs within were listed by field personnel and then subsampled. In addition, sample LAs were selected from supplemental frames that included mobile home parks and new construction for which permits were issued prior to January 1, 1970, but for which construction was not completed until after April 1, 1970. Approximately 26,000 living quarters were originally designated for the sample. For wave 1, interviews were obtained from the occupants of about 19,900 of the 26,000 designated living quarters. Most of the remaining 6,100 living quarters were found to be vacant, demolished, converted to nonresidential use, or otherwise ineligible for the survey. However, approximately 1,000 occupants refused to be interviewed, could not be found at home, were temporarily absent, or were otherwise unavailable. Thus, occupants of about 95 percent of all eligible living quarters participated in wave 1 of the survey.

For the subsequent waves, only original sample persons (those interviewed in the first wave) and persons living with them were eligible to be interviewed. With certain restrictions, original sample persons were to be followed if they moved to a new address. All noninterviewed households from wave 1 were automatically designated as noninterviews for all subsequent waves. When original sample persons moved without leaving a forwarding address, moved to extremely remote parts of the country, or refused to be interviewed, additional noninterviews resulted.

Sample households within a given panel are divided into four subsamples of nearly equal size. These subsamples are called rotation groups, denoted R (R = 1, 2, 3, or 4), and one rotation group is interviewed each month. Each household in the sample was scheduled to be interviewed at 4 month intervals over a period of 2 1/2 years beginning in October 1983. The reference period for the questions is the 4-month period preceding the interview month. In general, one cycle of four interviews covering the entire sample, using the same questionnaire, is called a wave.

Table 1 indicates the reference months and interview month for the collection of data from each rotation group for Wave 6. For example, rotation group 2 was interviewed in July 1985 and data for the reference months March 1985 through June 1985 were collected. Interviewing for Wave 9 followed the same pattern; however, the interview months were April (R=3), May (R=4), June (R=1), and July (R=2) 1986.

Table 1. Reference Months for Each Interview Month - Wave 6*

Month of Interview	Rotation	First Quarter (1985)	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Third Quarter (1985)
Reference Period												
May	4	X	X	X	X							
June	1			X	X	X						
July	2				X	X	X					
August	3					X	X	X				

* Wave 9 interview months are April through July

Each person received a base weight equal to the inverse of his/her probability of selection. The BIPP base weight W indicates that each BIPP sample person represents approximately W persons in the BIPP universe. Due to funding difficulties, a

The estimation procedure used to derive BIPP person weights involves several stages of weight adjustments. These include determining the base weight, adjusting for movers and noninterviews, adjusting to account for the BIPP sample areas not having the same population distribution as the strata from which they were selected and adjusting persons' weights to bring sample estimates into agreement with independent population estimates.

The Wave 6 and Wave 9 microdata research files include core data and supplemental (topical module) data. Core questions are repeated at each interview over the life of the panel. Topical modules include questions which are not asked every month. The Wave 6 topical module covers (1) 1984 calendar year earnings and benefits, (2) property income and taxes, and (3) education and training. The Wave 9 topical module covers the same areas for the 1985 calendar year. Some items in topical sections (1) and (2) are not included on the research files due to concerns about the data quality of these items. Items on monetary amounts and on ownership of rental property and other assets have been deleted from section (1). All items from section (2) have been deleted except for items on federal tax filing status, dependents, scheduled IRAs and KEOGH accounts, and property taxes. There are no plans for future release of the deleted data.

sample cut of 17.8 percent was implemented in March 1985. Each rotation group was reduced by about 850 interviewed housing units. In some instances, the base weight was adjusted to reflect subsampling done in the field. For each subsequent interview, each person received a base weight that accounted for following movers. A noninterview adjustment factor was applied to the weight of each interviewed person to account for persons in occupied living quarters who were eligible for the sample but were not interviewed. (Individual nonresponse within partially interviewed households was treated with imputation. No special adjustment was made for noninterviews in group quarters.)

A first stage ratio estimate factor was applied to each interviewed person's weight to account for the SIPP nonself-representation by race and by metropolitan and nonmetropolitan residence defined as of June 1981.

An additional stage of adjustment to persons' weights was performed to bring the sample estimates into agreement with independent monthly estimates of the civilian (and some military) noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1980 Decennial Census of Population; statistics on births, deaths, immigration, and emigration; and statistics on the

that sample estimates would agree with special Current Population Survey (CPS) estimates of the prevalence of different types of householders (married, single with relatives or single without relatives by sex and race) and different relationships to house- holders (spouse or other). Also, husbands and wives were assigned equal weights. As a result of these adjustments, the following types of consistency are attained by race and sex on a monthly basis:

these weights are reference month specific and therefore can be used only to form reference month estimates. To form an estimate for a particular month, use the reference month weight for the month, summing over all persons or households with the characteristic of interest whose reference period includes that month. Multiply the sum by a factor to account for the number of rotations contributing data for the month. This factor equals four divided by the number of rotations contributing data for the month. For example, in Wave 6, March data are only available from rotations 1, 2, and 4 (see Table 1), so a factor of $4/3$ must be applied. April data are available from all four rotations, so a factor of $4/4 = 1$ must be applied. Reference month estimates can be averaged to form estimates of monthly averages over some period of time. For example, using the proper Wave 6 weights, one can estimate the monthly average number of households in a specified income range over June and July 1985.

When estimates for all months except April are constructed from Wave 6 data, factors greater than 1 must be applied. However, when the Wave 6 core data are used in conjunction with the Wave 5 and Wave 7 core data, data from all four rotations will be available for December 1984 through August 1985, and the factors will equal 1 for those months. If Wave 6 and Wave 9 core data are used together, the factors will equal 1 for months December 1985 through March 1986.

To estimate monthly averages of a given measure (e.g., total, mean) over a number of consecutive months, sum the monthly esti-

The same procedure applies when creating estimates for particular identified MSAs or CMSA's--apply the factor appropriate to the state. For multi-state MSAs, use the factor appropriate to each state part. For example, to tabulate data for the Washington, DC-MD-VA MSA, apply the Virginia factor of 1.0778 to weights for residents of the Virginia part of the MSA; Maryland and Washington, DC residents require no modification to the weights (i.e., their factors equal 1.0).

In producing state estimates for a metropolitan characteristic, multiply the individual, family, or household weights by the metropolitan inflation factor for that state presented in table 4. (This inflation factor compensates for the subsampling of the metropolitan population and is 1.0 for the states with complete identification of the metropolitan population.)

Producing Estimates for the Metropolitan Population. For 15 states in the SIPP sample, metropolitan or nonmetropolitan residence is identified (Variable H*-METRD, characters 94, 382, 670, and 958). In 21 additional states, where the nonmetropolitan population in the sample was small enough to present a disclosure risk, a fraction of the metropolitan sample was recoded so as to be indistinguishable from nonmetropolitan cases (H*-METRD=2). In these states, therefore, the cases coded as metropolitan (H*-METRD=1) represent only a subsample of that population.

Some respondents do not respond to some of the questions. Therefore, the overall non-response rate for some items, such as income and money-related items is higher than the non-response rates in the above table. In particular, some Wave 6 and Wave 9 topical module items concerning earnings, property income, and Federal income tax amounts have very high non-response rates. For

Due to rounding of all numbers at 100, there are some inconsistencies. The percentage was calculated using unrounded numbers. At Wave 9, total eligible households had increased approximately 3 percent and non-response increased approximately 15 percent.

Sampling variability. Standard errors indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The standard errors for the most part measure the variations that occurred by chance because a sample rather than the entire population was surveyed.

Comparability with other statistics. Caution should be exercised when comparing data from this file with data from other SIPP products or with data from other surveys. The comparability problems are caused by the seasonal patterns for many characteristics and by different nonsampling errors.

Source of Data. The deleted items are described under the section titled "Source of Data." The deleted items are especially severe have been deleted from the research files. Thus, items for which nonresponse on other rates of some Wave 6 and Wave 9 topical module items is not considered to be possible. However, an adequate weighting adjustment for the high nonresponse rates of some Wave 6 and Wave 9 topical module items is not known precisely; they are considered to be generally adequate. Although the success of these techniques in avoiding bias is not known precisely, they are considered to be generally adequate. Similar nonresponse rates are seen in Wave 9. Standard Error Parameters and Their Use. Most of the SIP statistics have greater variance than those obtained through a simple random sample because clusters of living quarters are sampled for SIP. To derive standard errors that would be applicable to a wide variety of statistics and could be prepared at a

Note when using small estimates. Because of the large standard errors involved, there is little chance that estimates will reveal useful information when computed on a base smaller than 200,000. Nonsampling error can occasionally occur in one of the small number of cases used in the estimate, causing large relative error in that particular estimate. Also, care must be taken in the interpretation of small differences. Even a small amount of nonsampling error can cause a borderline difference to appear significant or not; thus distorting a seemingly valid hypothesis test.

A subsequent section explains how to derive a standard error on the difference $X_0 - X_1$. Let that standard error be s_{diff} . If $X_0 - X_1$ is between -1.6 times s_{diff} and $+1.6$ times s_{diff} , no conclusion about the parameters is justified at the 10 percent significance level. If, on the other hand, $X_0 - X_1$ is smaller than -1.6 times s_{diff} or larger than $+1.6$ times s_{diff} , the observed difference is significant at the 10 percent level. In this event, it is commonly accepted practice to say that the parameters are different. Of course, sometimes this conclusion will be wrong. When the parameters are, in fact, the same, there is a 10 percent chance of concluding that they are different.

moderate cost, a number of approximations were required. Statistics with similar variance behavior were grouped together and two parameters (denoted "a" and "b") were developed to approximate the variance behavior of each group of statistics. These "a" and "b" parameters are used in estimating standard errors of survey estimates and vary by type of estimate and by subgroup to which the estimate applies. Table 3 provides base "a" and "b" parameters for various subgroups and types of estimates. For SIPP Wave 6 and Wave 9 core and topical module characteristics, factors for each of the single reference months, January through July 1985 and December 1985 through June 1986, are provided. The factor multiplied by the base parameters for a given subgroup and type of estimate gives the "a" and "b" parameters for that subgroup and estimate type in the chosen time period. For example, the base "a" and "b" parameters for total income of households are -0.000993 and 8582 , respectively. The factor for January 1985 is 4 , so that "a" and "b" parameters for total household income in January 1985 are -0.003972 and $34,328$, respectively.

The "a" and "b" parameters may be used to calculate the standard error for estimated numbers and percentages. Because the actual variance behavior was not identical for all statistics within a group, the standard errors computed from these parameters provide an indication of the order of magnitude of the standard error for any specific statistic. Methods for using these parameters for computation of approximate standard errors are given in the following sections.

Standard error of a median. The median quantity of some items such as income for a given group of persons, families, or households is that quantity such that at least half the group have as much or more and at least half the group have as much or less. The sampling variability of an estimated median depends upon the form of the distribution of the item as well as the size of the group. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 66 percent confidence limits and hence the standard error of a median based on sample data.

Illustration of confidence interval and standard error computation for a median. To illustrate the calculations for the sampling error on a median, we return to the same example used to illustrate the standard error of a mean. The median monthly income for this group is \$2,158. The size of the group is 39,851,000.

It should be noted that a mathematically equivalent result is obtained by using common logarithms (base 10) and antilogarithms.

- Using formula (2), the standard error of 50 percent on a base of 39,851,000 is about 0.7 percentage points.
- Following step (2), the two percentages of interest are 49.3 and 50.7.
- By examining table 2, we see that the percentage 49.3 falls in the income interval from \$2,000 to \$2,499. (Since 55.5 percent receive more than \$1,999 per month, but only 40.9 percent receive more than \$2,499 per month, the quantity that exactly 49.3 percent receive more than must be between \$2,000 and \$2,499.) Thus $A_1 = \$2,000$, $A_2 = \$2,500$, $N_1 = 22,106,000$, and $N_2 = 16,307,000$. Implementing Pareto interpolation, the upper bound of a 58 percent confidence interval for the median is

$$\text{exp} \left[\frac{\ln (.493) (39,851,000)}{22,106,000} - \frac{\ln 2,500}{16,307,000} \right] = \$2,181$$

Also by examining table 2, we see that the percentage 50.7 falls in the same income interval. Thus, A_1 , A_2 , N_1 , and N_2 are the same. So the lower bound of a 58 percent confidence interval for the median is

$$\text{exp} \left[\frac{\ln (.507) (39,851,000)}{22,106,000} - \frac{\ln 2,500}{16,307,000} \right] = \$2,136$$

Thus, the 68 percent confidence interval on the estimated median is from \$2,136 to \$2,181. An approximate standard error is

$$\frac{\$2,181 - \$2,136}{2} = \$23.$$

Using linear interpolation, the 68 percent confidence interval of the estimated median is \$2,164 to \$2,212 and the approximate standard error is \$24.

Standard errors of ratios of means and medians. The standard

error for a ratio of means or medians is approximated by formula (9):

$$\frac{\left(\frac{y}{x}\right)}{r} = \sqrt{\left(\frac{y}{x}\right)^2 \left(\frac{s_y}{\bar{y}}\right)^2 + \left(\frac{y}{x}\right)^2 \left(\frac{s_x}{\bar{x}}\right)^2} \quad (9)$$

where x and y are the means or medians, and s_x and s_y are their associated standard errors. Formula (9) assumes that the means or medians are not correlated. If the correlation between the two means or medians is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error for the ratio of means and medians.

SIPP DATA REVIEW: Wave 9 1984 Panel Education Financing

October 1987

INTRODUCTION

This report provides a review of the data quality of the Wave 9 Education Financing topical module in the 1984 panel of the Survey of Income and Program Participation (SIPP). The data are discussed in the context of sample attrition, module nonresponse, item nonresponse, and overall reasonableness of the data.

SAMPLE ATTRITION

A rectangular data file of the wave 9 financing and training data was constructed using the SIPP program. The file contains 31,978 person records; the universe of interest for tabulation are those persons who have non-zero weights in the interview month, which is 31,027 cases. A tabulation of selected unweighted items matches DSD post-edit/imputation control counts exactly.

The number of households eligible for interviewing in wave 9 was 18,081; of these, 14,885, about 82%, were successfully interviewed. Within households, there is also loss of persons. As with entire households, this loss may be due to refusals, or because a given individual has moved and cannot be followed. The loss of persons in interviewed households in wave 9 was 955 persons, or 3.0 percent of the eligible person population. This includes persons who may have been in sample for part of the wave, but who are out of sample by the interview month. (Since the topical module is referenced to the interview month only, calculating loss relative to this point is the most reasonable method.) Table 1 shows the pattern of loss for several basic demographic factors. Tests for significant patterns of loss in the sample data are made using a chi-square test that has been adjusted for the sample design. The sample adjustment is to divide the calculated chi-square value by 3. Using this method we find significant loss by race, age and education, with greater loss occurring for persons who are black, those with less than 35 years of age and those with less than 9 years of education.

ITEM AND MODULE NONRESPONSE

In addition to the loss of data caused by noninterviewed households and persons, information is also lost because of simple nonresponse. Persons may not respond for a variety of reasons, and nonresponse may occur for the entire topical module, or only for selected items. In Wave 9 1560 of the non-zero weight persons, about 5.0% of this "active" sample, did not respond to the entire module. Table 2 summarizes the distribution of module nonresponse by several basic demographics. Total nonresponse appears to have been somewhat more common among nonwhites, men, younger persons and proxy interviewers. Despite the presence of the total module nonrespondents, most module questions are answered by most persons: of the 5495 persons responding "yes" to the first item (9610), 79% had no imputed items in this section, and 94% had 2 or fewer imputations.

Table 3 shows the nonresponse numbers and rates for each of the specific items in the module that could be imputed. Note that the basic item on enrollment (SC9610) and the actual yes/no items for reciprocity (e.g., SC9628, SC9632, SC9636, SC9672) were not a part of the imputation scheme. (Beginning with the 1985 panel these items will be imputed.) The item skip pattern modify the interview universe for any given question, rates imputation rates are calculated using only the appropriate denominator; since skip pattern modify the interview universe for any given question, rates calculated on the entire sample universe may be quite misleading. These adjusted item nonresponse rates avoid this problem.

In general, the rates for the educational financing section are somewhat high, primarily because they require the reporting of specific amounts, instead of choices from a list of closed-ended categories. The imputation rates for tuition, books, and room and board were 19, 21 and 33 percent, respectively. (In wave 6 they were 20, 23 and 32.) It is important to note that about 60% of all answers of "yes" in item SC9610 were given by a proxy respondent. Since this answer determines the sub-universe for the remaining questions, over half of the amounts data is being provided by someone other than the actual subject. In the cases of the tuition and books items (which have the greatest number of sample cases for any of the amount items), nonresponse rates by proxy are 3 times as large as those of self-respondents (about 11 vs. 33 percent). Nonresponse for aid reciprocity amounts is also high: the unweighted average nonresponse rate for the 12 different aid sources is about 22%. Of course, some aid sources are reported by only a dozen or so sample respondents, and only three occur for more than 50 cases. Overall, the general magnitude and pattern of nonresponse is very similar to that in the wave 6 module of educational financing.

REASONABLENESS OF DATA

The comparison of weighted survey estimates to estimates derived from other sources acts as a final check of the general quality of the data. Sample loss and nonresponse notwithstanding, if editing, imputation and weighted procedures are properly applied, the final weighted data should compare favorably, at least in univariate or bivariate context, with other known estimates of the same phenomenon.

A. School Enrollment

The initial question asks persons if they were enrolled in school anytime during the past year. The parenthetical expression instructs the interviewer to tell the respondent to include any regular school such as elementary, high school or college, or any vocational, technical or business school. Clearly, this is a very general question, and should elicit a large number of responses. In fact it does, yielding a weighted estimate of about 32.7 million persons. Unfortunately, there is no number which can provide a good basis for comparison. School enrollment is generally determined in a "snapshot" context, that is, as of a certain date what numbers of people were and were not enrolled in school. The October Current Population Survey, for instance, is the other basic Census tool for measuring school enrollment. Here, the item concerning enrollment is referenced to the interview week. Other surveys conducted by the Department of Education and the National Center for Education Statistics also use a "snapshot" approach in collecting data. At levels beyond high school, enrollment may not be a year-long activity; people move in and out of the system much more rapidly.

The major data in this section are those concerning the receipt of educational aid and the amount of various sources. Respondents are able to report the receipt of 11 different types of financial aid as well as a weight residual "anything else" category. Some of the types of aid for which data is collected correspond closely to known financial aid programs, while others are of a more general nature. The table below shows the comparison of weighted SIPP estimates, both in terms of recipients and average amounts, to administrative data (where it is available).

C. Financial Aid Reciprocity

The first amount items in the section ask questions regarding the costs of education, including tuition and fees, books and supplies and room and board for persons living away at school. Strictly comparable figures are not available, but estimates for undergraduate college students published by the Department of Education probably provide the best administrative data. For the 1985-86 school year (the period most comparable to the SIPP period of reference for this module), the average tuition and fees were estimated by Education to be \$2110. The SIPP estimate for persons in college grades 1 through 4 is computed as \$1683. The cost of room and board as determined by Education was \$2710 a year; the corresponding SIPP estimate is \$2313. These underestimates by SIPP replicate the pattern first identified in the Wave 6 data. While the ratio of SIPP to administrative estimate remained about the same for tuition (about .8), the ratio for room and board appears to have worsened a bit (.96 in wave 6, .85 in wave 9).

B. Educational Costs

Consequently, estimates obtained from the snapshot approach should be less than those yielded by a question such as the one used in SIPP. The point of closest correspondence should occur at the elementary and high school level, where fall enrollment numbers probably accurately reflect how many persons will be in those levels at any time during the year. At the combined elementary and secondary level, the SIPP estimate of 13.7 million persons is somewhat lower than the 14.8 million persons who were enrolled in the fall of 1985 and who should be at least 15 years of age (the age necessary for SIPP eligibility) by the time of the SIPP interview during the summer of 1986. The SIPP college estimate of 14.2 million persons is higher than the October 1985 CPS estimate of 12.5 million. This is what we would expect, given that many college students are not full-time, full-year students, but take only an occasional or one-time course. Evaluation of enrollment in other types of schooling (vocational, technical and business) is not possible quantitatively, since these data are not collected in any routine manner. Comparison with estimates from Wave 6 data, however, indicates levels and numbers roughly comparable with those data.

With respect to the total number of recipients in specific programs, the general pattern of the data indicates that SIPP estimates are sometimes considerably lower than the numbers provided by administrative sources. Part of the problem stems from the fact that administrative estimates may not be directly comparable in all cases to the reference period for the SIPP data, but this does not appear to be a major consideration. A different source of error seems more serious. The values shown in parentheses represent the numbers of persons in each of the categories who reported in the core of the wave 9 interview that they had received the financial aid in question sometime during the past four months, but who, in the topical module, reported that they had not received the same item anytime in the past year. As can be seen, some of the financial aid amounts show a severe level of misreporting. If the editing routine for the data were to impute a positive ("received") response in the topical module for those persons who reported reciprocity in core, the total number estimated by SIPP would in some cases be within sampling error of the administrative estimates. For the two largest programs, Pell Grants and Guaranteed Student Loans, however, the SIPP estimate would still be too low. One possibility is that the large proportion of answers given by proxy respondents underlies both the overall underreporting of aid sources as well as the inconsistent patterns of reporting. Regardless of the source of the problem, the fact that the SIPP estimates are worst for the largest programs is an especially troubling point.

Examination of the dollar amounts reported by the recipients of these programs also lends some cause for concern. The right-hand side of the table shows the mean amount for various programs as reported in SIPP and, where available, the comparable administrative program estimates. While the mean amounts received for several programs correspond closely to the administrative numbers (including those for the Pell and GSI programs), the amounts reported for two programs, SBOG and NDSL, are about twice as much in SIPP as the program estimate. Again, the source of this problem can only be speculated upon. Unfortunately, for many other sources of educational aid, comparable data do not exist; thus it is not possible to determine if the estimates of sources such as "employer assistance" and "tuition reductions" are accurate.

The discrepancy between the SIFF and administrative estimates are quite large, and in fact seem to have worsened since the wave 6 data collection. In wave 6 the SIFF estimate (including the inconsistent cases) was about 78% of the administrative estimate by wave 9 this same comparison is about 66%. One possibility is that the continuing sample attrition may disproportionately include those persons most likely to participate in educational financing programs. The sample descriptive analyses of sample degradation seem to lend some support to this notion. In addition, as was noted in the wave 6 review, the possibility remains that while specific types of aid or amounts of a specific source are misestimated, the number of persons receiving aid regardless of source, or the amount of the overall "aid package" may not be as unreasonable. There still do not exist any independent data which would allow us to confirm or reject this hypothesis.

	Administrative Estimate	Inconsistent Core Cases	Module Estimate
Wave 6	8,438,000	1,203,000	5,369,000
Wave 9	9,165,000	559,000	5,538,000

The underestimation of the basic counts of recipients, inconsistencies between core and the topical module, and discrepant mean amounts all closely replicate the patterns first observed in the wave 6 financing data. The only major difference is that the total (and proportionate) amount of core-to-module inconsistency is somewhat smaller, but this does not translate into better overall module estimates of the total number of recipients. The table below shows the combined estimates for the five major college financing programs (work study, Pell, SBOG, NDSL, and ESL) for both the wave 6 and wave 9 topical modules. The first column shows the SIFF estimate based on the topical module alone, while the second column shows how many additional "inconsistent cases" could be added from positive responses offered in the core interview only. As can be seen, estimated inconsistencies dropped by about half in the one-year period between waves 6 and 9. Part of this may be due to the loss of persons from sample who are likely to provide inconsistent types of information, but this is speculation. The third column shows the unduplicated number of persons based on administrative counts for these same five major programs.

SUMMARY

As with wave 6, caution should be exercised in using the wave 9 educational financing data. In general terms, SIFP continues to underestimate many of the relevant educational phenomena; persons enrolled receipt of any aid, sources of aid and their amounts. The lack of recognized reliable administrative data dampens the depth of the criticism, but in many cases where believable secondary data can be obtained, the SIFP data does not compare favorably. As was noted in the wave 6 review, there are several key reasons why these data are less than optimal, some of which we may be able to respond to in future activities. These include:

1) **Edits/Imputations** - Comparison of the topical module data to core shows a nontrivial number of persons who gave inconsistent answers in the two sections. Beginning with the 1985 panel, core items were modified to more accurately mirror the topical module items. This will allow us to use a "dependent" editing scheme that should raise the overall number of enrollees, aid recipients in general and recipients of specific aid sources.

2) **Proxy responses** - Probably because of the nature of the subpopulation of concern (i.e., students away at school), proxy response is quite high for the enrollment and financial aid items. This in turn acts to drive up the nonresponse (and imputation) rate, particularly of items which do not have closed-ended response categories, and items which require an amount as a response.

3) **Amounts** - In general, the ability of an individual to return a reliable amount (or any amount), even for self-respondents, is less than the ability to return a yes-no or closed-ended response. The simple item non-response rates of amount items vs. other types of items demonstrates this point.

4) **Magnitude of phenomenon** - Certain financial aid programs are relatively small in size. The ability to generate reliable estimates for these small programs may be jeopardized simply by the fact that they occur so infrequently. Some consideration should be given to either the consolidation or elimination from the survey of very small or definitionally ambiguous programs.
