

# Wealth inequality, family background, and estate taxation

Mariacristina De Nardi<sup>1</sup> Fang Yang<sup>2</sup>

<sup>1</sup>UCL, Federal Reserve Bank of Chicago, IFS, and NBER

<sup>2</sup>Louisiana State University

June 8, 2015

## The estate tax is very controversial

- “The estate tax is immoral and counter-productive... My office has received hundreds of letters and emails from individuals... These people are not rich, but they have worked hard and saved to create an inheritance for their children...”  
Ron Paul, district of Texas.

## The estate tax is very controversial

- “The estate tax is immoral and counter-productive... My office has received hundreds of letters and emails from individuals... These people are not rich, but they have worked hard and saved to create an inheritance for their children...”  
Ron Paul, district of Texas.
- “I have continuously supported reforming the estate tax, but a complete repeal is fiscally irresponsible, and serves to benefit only mega multi-millionaires while harming our economy...”  
Bart Stupak, district of Michigan.

## We study estate taxation reform in a model in which

- There is realistic wealth inequality. Why?
  - The estate tax hits the rich.  $\Rightarrow$  We need a model that generates a small number of very rich people.

## We study estate taxation reform in a model in which

- There is realistic wealth inequality. Why?
  - The estate tax hits the rich.  $\Rightarrow$  We need a model that generates a small number of very rich people.
- Parental background influences one's lot in life. Why?
  - Individual level: parental background and initial conditions are empirically important (Keane and Wolpin (1997), Heatcote, Storesletten, Violante (2005), Huggett, Ventura and Yaron (2011), Solon...)

## We study estate taxation reform in a model in which

- There is realistic wealth inequality. Why?
  - The estate tax hits the rich.  $\Rightarrow$  We need a model that generates a small number of very rich people.
- Parental background influences one's lot in life. Why?
  - Individual level: parental background and initial conditions are empirically important (Keane and Wolpin (1997), Heatcote, Storesletten, Violante (2005), Huggett, Ventura and Yaron (2011), Solon...)
  - Aggregate level: large amount of wealth (both wealth and human capital) transmitted across generations (Kotlikoff and Summers (1981) vs. Modigliani (1988), Gale and Scholz (1994)).

## The economics of the model

- Bequest motives + inheritance of ability across generations.

## The economics of the model

- Bequest motives + inheritance of ability across generations.
- How does parental background matter in our framework?
  - It affects one's initial earnings (persistent) and hence lifetime earnings.
  - It affects the bequest that the person is going to receive, hence lifetime resources.

## The economics of the model

- Bequest motives + inheritance of ability across generations.
- How does parental background matter in our framework?
  - It affects one's initial earnings (persistent) and hence lifetime earnings.
  - It affects the bequest that the person is going to receive, hence lifetime resources.
- An earnings process that allows for high earnings risk for top earners. (Guvenen et al. (2014) and (2015), DeBacker et al. (2015), Panousi et al. (2015)).

## Strategy and goals

- Develop a model that matches well:
  - Distribution of wealth.
  - Distribution of of bequests.

## Strategy and goals

- Develop a model that matches well:
  - Distribution of wealth.
  - Distribution of of bequests.
- Analyze effects of estate taxation on
  - Aggregate capital accumulation.
  - Wealth inequality.
  - Parental background as a source of inequality.
  - Welfare ex-ante and conditional on one's initial earnings.

## Strategy and goals

- Develop a model that matches well:
  - Distribution of wealth.
  - Distribution of of bequests.
- Analyze effects of estate taxation on
  - Aggregate capital accumulation.
  - Wealth inequality.
  - Parental background as a source of inequality.
  - Welfare ex-ante and conditional on one's initial earnings.
- Study robustness of results to modeling the bequest motive.
  - Qualitative literature stresses importance of specific bequest motive in affecting results.
  - It is still unclear how we should best model bequest motives.

## Literature, wealth inequality

- Mechanisms that keep the saving rate of the rich high and thus generate wealth inequality.
  - Intergenerational links (bequest motives and transmission of human capital). De Nardi (2004), De Nardi and Yang (2014), and Nishiyama (2002).
  - High earnings risk for the top earners. Castañeda et al. (2003).
  - Heterogenous patience. Krusell and Smith (1998).
  - Entrepreneurship, borrowing constraints, and risky returns. Quadrini (1999), Cagetti and De Nardi (2006).

## Literature, wealth inequality and estate taxation

- Entrepreneurship + altruism: Cagetti and De Nardi (2009).
- High earnings risk for the top earners + altruism: Castañeda et al. (2003).

⇒ Abolishing estate taxation: relatively small aggregate and distributional effects.

## Model key elements

- OLG general equilibrium model.
- Intergenerational transfer of bequests and human capital.

## Model key elements

- OLG general equilibrium model.
- Intergenerational transfer of bequests and human capital.
- Exogenous earnings profile (with earnings shocks).
- Government taxes, expenditure, and social security system.
- No aggregate shocks nor changes over time (stationary equilibrium). Focus on the 1990s period.

## Representative firm

- Neoclassical production function:  $F(K; L) = K^\alpha L^{1-\alpha}$ .
- Physical capital depreciates at rate  $\delta$ .
- Factor prices equal marginal products.

# Government

- Tax rate on labor income:  $\tau_l$ .
- Tax rate on capital income:  $\tau_a$ .
- Tax rate on bequest:  $\tau_b$  on estate above exemption level:  $x_b$ .
- Government spending:  $g$ .

# Government

- Tax rate on labor income:  $\tau_l$ .
- Tax rate on capital income:  $\tau_a$ .
- Tax rate on bequest:  $\tau_b$  on estate above exemption level:  $x_b$ .
- Government spending:  $g$ .
- Pay-as-you-go system; tax rate of  $\tau_s$  and pension linked to income history  $P(\tilde{y})$ .

## Demographics

- Constant population growth:  $n$ .
- 1 period = 5 years.

Generation  $t-7$  (Parents)

Generation  $t$

Generation  $t+7$  (Children)

## Household preferences

- Discount factor:  $\beta$ .
- Period utility from consumption:  $\frac{c_t^{1-\sigma}}{1-\sigma}$ .
- utility from bequest:

$$\phi(b'_k) = \phi_1 \left[ (b'_k + \phi_2)^{1-\sigma} - 1 \right].$$

## Household preferences

- Discount factor:  $\beta$ .
- Period utility from consumption:  $\frac{c_t^{1-\sigma}}{1-\sigma}$ .
- utility from bequest:

$$\phi(b'_k) = \phi_1 \left[ (b'_k + \phi_2)^{1-\sigma} - 1 \right].$$

- Gross bequest model: set  $b'_k = b'_g$ .
- Net bequest model: set  $b'_k = b'_n = b'_g - \tau_b * \max(b'_g - x_b, 0)$ .

## Household earnings process

- Deterministic age-efficiency profile:  $\epsilon_t$ .
- Shocks:  $z_t^i$ ,  $AR(1)$  process, as Castañeda et al. (2003).
  - Three levels from PSID.
  - Fourth level: high earnings, high volatility state.

PSID captures dynamics well for most of population but misses really high earners, who also face high earnings volatility.

⇒ Model for levels of  $z_t^i$

- Total productivity:  $y_t^i = e^{z_t^i + \epsilon_t}$

## Household earnings process

- Deterministic age-efficiency profile:  $\epsilon_t$ .
- Shocks:  $z_t^i$ ,  $AR(1)$  process, as Castañeda et al. (2003).
  - Three levels from PSID.
  - Fourth level: high earnings, high volatility state.

PSID captures dynamics well for most of population but misses really high earners, who also face high earnings volatility.

⇒ Model for levels of  $z_t^i$

- Total productivity:  $y_t^i = e^{z_t^i + \epsilon_t}$
- Labor productivity inheritance process:
 
$$z_1^j = \rho_h z_0^j + \nu^j, \nu^j \sim N(0, \sigma_h^2)$$

## Household's recursive problems

- Household's State Variables
  - $t$  : Age.
  - $a$  : Net worth from previous period.
  - $z$  : Current earnings shock.
  - $\tilde{y}$  : Annual accumulated earnings, up to a social security cap,  $\tilde{y}_c$ , used to compute Social Security payments.

## Household's recursive problems

- Household's State Variables
  - $t$  : Age.
  - $a$  : Net worth from previous period.
  - $z$  : Current earnings shock.
  - $\tilde{y}$  : Annual accumulated earnings, up to a social security cap,  $\tilde{y}_c$ , used to compute Social Security payments.
  - $S_p$  : Parental state variables  $S_p = (a_p, z_p, \tilde{y}_p)$ .

## Household's recursive problems

- Household's State Variables
  - $t$  : Age.
  - $a$  : Net worth from previous period.
  - $z$  : Current earnings shock.
  - $\tilde{y}$  : Annual accumulated earnings, up to a social security cap,  $\tilde{y}_c$ , used to compute Social Security payments.
  - $S_p$  : Parental state variables  $S_p = (a_p, z_p, \tilde{y}_p)$ .
- Three cases
  - Working age agents without parents (already inherited)
  - Working age agents with parents alive
  - Retired agents

## Working age agents who have already inherited

$$V_w'(t, a, z, \tilde{y}) = \max_{c, a'} \left\{ U(c) + \beta E[V'(t+1, a', z', \tilde{y}')] \right\}, \quad (1)$$

$$c + a' = (1 - \tau_l)wy - \tau_s \min(wy, 5\tilde{y}_c) + [1 + r(1 - \tau_a)]a, \quad (2)$$

$$a' \geq 0, \quad (3)$$

$$\tilde{y}' = [(t-1)\tilde{y} + \min(wy/5, \tilde{y}_c)]/t, \quad (4)$$

## Working age agents with parents alive

$$V_w(t, a, z, \tilde{y}, S_p) = \max_{c, a'} \left\{ U(c) + \beta p_{t+7} E[V_w(t+1, a', z', \tilde{y}', S'_p)] + \beta(1 - p_{t+7}) E[V'_w(t+1, a' + b'_n/N, z', \tilde{y}')] \right\},$$

subject to

$$c + a' = (1 - \tau_l)wy - \tau_s \min(wy, 5\tilde{y}_c) + [1 + r(1 - \tau_a)]a, \quad (5)$$

$$a' \geq 0, \quad (6)$$

$$\tilde{y}' = [(t - 1)\tilde{y} + \min(wy/5, \tilde{y}_c)]/t, \quad (7)$$

$$\tilde{y}'_p = \begin{cases} [(t + 6)\tilde{y}_p + \min((wy_p/5, \tilde{y}_c)]/(t + 7) & \text{if } t < 3 \\ \tilde{y}_p & \text{otherwise} \end{cases} \quad (8)$$

$$b'_n = b'_n(S_p), \quad (9)$$

## Retired agents

$$V_r(t, a, \tilde{y}) = \max_{c, a'} \left\{ U(c) + \beta p_t V_r(t+1, a', \tilde{y}) + (1-p_t)\phi(b'_k) \right\}, \quad (10)$$

subject to

$$a' \geq 0, \quad (11)$$

$$c + a' = [1 + r(1 - \tau_a)]a + (1 - \tau_l)P(\tilde{y}) \quad (12)$$

## Exogenous Parameters

	Parameters		Value
Demographics	$n$	annual population growth	1.2%
	$p_t$	survival probability	see text
Preferences	$\gamma$	risk aversion coefficient	1.5
Labor earnings	$\epsilon_t$	age-efficiency profile	see text
	$\rho_h$	AR(1) coef. of prod. inherit. process	0.40
	$\sigma_h^2$	innovation of prod. inherit. process	0.37

## Exogenous parameters

	Parameters		Value
Production	$\alpha$	capital income share	0.36
	$\delta$	depreciation	6.0%
Government policy	$\tau_a$	capital income tax	20%
	$P(\tilde{y})$	Social Security benefit	see text
	$\tau_s$	Social Security tax	12.0%

## Labor income process

- 4 earnings states: low, middle, high, and super-high, [1.0, 3.15, 9.78, 1, 061] (from Castañeda et al.)

## Labor income process

- 4 earnings states: low, middle, high, and super-high, [1.0, 3.15, 9.78, 1, 061] (from Castañeda et al.)
- Transition matrix for lowest three grid points based on PSID.

## Labor income process

- 4 earnings states: low, middle, high, and super-high, [1.0, 3.15, 9.78, 1, 061] (from Castañeda et al.)
- Transition matrix for lowest three grid points based on PSID.
- Pick remaining six elements of our 4x4 transition matrix  $Q_y$ .

	Gini	Percentile (%)					
		1	5	20	40	60	80
SCF	0.63	14.76	31.13	61.39	84.72	97.21	100.00
All models	0.62	14.64	31.93	62.45	84.05	93.00	100.00

Table : Percentage of earnings in the top percentiles.

## Labor income process

Transition matrix for  $Q_y$

$$\begin{bmatrix} 0.8239 & 0.1733 & 0.0027 & 0.000070 \\ 0.2171 & 0.6399 & 0.1428 & 0.000196 \\ 0.0067 & 0.2599 & 0.7332 & 0.000198 \\ 0.1117 & 0.0000 & 0.0794 & 0.808958 \end{bmatrix}.$$

The transition matrix for  $Q_{yh}$

$$\begin{bmatrix} 0.8272 & 0.1704 & 0.0024 & 0.0000000000 \\ 0.5748 & 0.4056 & 0.0196 & 0.0000000000 \\ 0.2890 & 0.6173 & 0.0937 & 0.0000000005 \\ 0.0001 & 0.0387 & 0.9599 & 0.0012647506 \end{bmatrix}.$$

⇒ Initial prob. distribution of earnings: [65% 33% 2% 0.00007%].

Fraction of sup-rich income goes up to 0.04% at age 60.

## Benchmark: remaining parameters to match

Parameters	Benchmark	Gross Bequests	No Bequest Motives
$\beta$ discount factor	0.9454	0.9455	0.9525
$\phi_1$ bequest utility	-5.4473	-6.1561	0.0000
$\phi_2$ bequest shifter	1095K	1376K	0.0000
$\tau_b$ estate tax	21.43%	21.30%	62.94%
$x_b$ estate exem	756K	786K	745K
$\tau_l$ labor tax	19.20%	19.20%	19.20%

Moment	Data	Benchmark	Gross Bequests	No Bequest Motives
Wealth/output	3.10	3.10	3.10	3.11
Bequest/wealth	0.88-1.18%	0.88%	0.88%	0.58%
90th perc. bequests	4.34	4.51	4.29	4.71
% estates taxed	2.0%	1.92%	1.92%	2.04%
Estate tax/output	0.33%	0.33%	0.33%	0.32%
Gvt spending/output	18%	18.00%	18.00%	18.00%

## Calibration of various models

- Re-calibrate gross bequest motive model to target same moments.
- No bequest motive model, calibrate what it can match.
  - ⇒ Bequest/wealth ratio too low (0.58 compared to 0.88%).
  - ⇒ Does not generate very large estates observed in the data.
  - ⇒ Estate tax rate is 64%.

## Wealth inequality

- Models with bequest motives fit distribution of wealth well.

	Gini	Percentile (%)					
		1	5	20	40	60	80
1998 SCF	0.80	34.7	57.8	69.1	81.7	93.9	98.9
Benchmark	0.80	35.2	51.9	66.1	82.9	95.3	99.6
Gross bequests	0.80	35.3	52.1	66.3	83.0	95.3	99.6
No beq. motives	0.76	25.8	44.1	59.7	78.5	93.5	99.1

**Table :** Percentage of total wealth held by households in the top percentiles.

## Gini by age

- Models with bequest motives closer to observed Gini by age.

## Tax incidence

Wealth Percentile	Age	Capital tax	Labor tax	Estate Tax	Total tax
0-1%	64.26	35.79	7.74	98.84	15.65
1-5%	61.80	18.14	7.66	1.16	9.86
5-10%	59.18	14.94	8.87	0.00	10.05

**Table :** Percentage of the total for a given tax paid by a selected wealth percentile.

- Labor income tax burden is more evenly distributed than the capital income tax.
- Estate tax burden is the most unevenly distributed.

## Family background

- Parental background is very important.

Parent's earnings	Moving to parent's earnings		
	1st	2nd	3rd
Bequests only			
2nd	0.06	-	-
3rd	0.57	0.42	-
4th	14.87	14.71	13.98
Bequests + human capital inheritance			
2nd	0.06	-	-
3rd	5.59	5.43	-
4th	35.71	35.50	28.41

**Table :** Asset compensation required for moving from a parental background level to another, normalized as a fraction of average income.

## Policy experiments

### Benchmark (net bequest motive)

- Vary two key margins of estate taxation:
  - Marginal tax rate  $\tau_b$ .
  - Estate tax threshold  $x_b$ .
- Adjust
  - Capital income  $\tau_a$ .
  - Labor income tax  $\tau_l$ .

Gross bequest motive.

Fully altruistic dynastic models.

## Policy experiments

Study the effects of each reform on

- Aggregate capital and output.
- Wealth inequality.
- Importance of parental background.
- Welfare.

## Aggregate Effects, Adjusting the Capital Income Tax

$\tau_b$	$x_b$	$\tau_a$	K	Y	r	wage
Net bequest model, changing the estate tax rate						
0.00	–	21.6%	+0.71%	+0.25%	5.580	0.490
0.21	756K	20.0%	3.100	1.000	5.622	0.489
0.40	756K	18.7%	-0.59%	-0.21%	5.658	0.488
0.60	756K	17.0%	-0.53%	-0.19%	5.654	0.488
Net bequest model, changing estate tax rate and exemption level						
0.55	675K	17.4%	-0.74%	-0.27%	6.667	0.488

- $\uparrow$  estate taxation  $\Rightarrow$   $\downarrow$  aggregate capital and income, up to  $\tau_b = 50\%$ .
- Statutory tax policy minimizes aggregate capital among all of the tax configurations that we have tried.

## Distributional effects, adjusting the capital income tax

$\tau_b$	$x_b$	$\tau_a$	Gini	Percentile (%)			
				1	5	20	40
Net bequest model, change the estate tax rate							
0.00	–	0.216	0.811	36.91	53.34	67.28	83.61
0.21	756K	0.200	0.804	35.15	51.90	66.09	82.89
0.40	756K	0.187	0.798	33.78	50.71	65.10	82.27
0.60	756K	0.170	0.793	32.83	49.82	64.27	81.67
Net bequest model, year 2000 statutory estate tax							
0.55	675K	0.174	0.794	32.99	49.98	64.43	81.74

- The share of wealth held by the richest is monotonically decreasing in the estate tax rate.
- Statutory tax policy reduces wealth concentration.

## Importance of parental background effects

Parent's earnings	Moving to parent's earnings		
	1st	2nd	3rd
Benchmark			
2nd	0.06	-	-
3rd	5.59	5.43	-
4th	<b>35.71</b>	35.50	28.41
Net bequest model, year 2000 statutory estate tax			
2nd	0.07	-	-
3rd	5.46	5.29	-
4th	<b>33.70</b>	33.52	26.73

- Born to a family with the 4th parental background less important.
- Other group of people are barely affected.

## Welfare effects, going to year 2000 statutory estate tax

All	Initial Earnings				Fraction Gaining
	1st	2nd	3rd	4th	
<b>Partial equilibrium</b>					
Net bequest motive, capital income tax ↓					
0.015	0.004	0.027	0.134	-77.277	0.961
<b>General equilibrium</b>					
Net bequest motive, capital income tax ↓					
0.005	-0.003	0.013	0.115	-75.100	0.384

- PE: Majority of the population gains ( $> 95\%$ ).
- PE: Average gains for 1st, 2nd, 3rd productivity levels, loss for 4th.
- GE: ↓ wage rate  $\Rightarrow$  welfare loss. ↑ interest rate  $\Rightarrow$  welfare gain of the savers.

## Aggregate effects, comparing capital and labor income tax

$\tau_b$	$x_b$	$r$	wage	$\tau_a$	$K$	$Y$
Net bequest model, changing capital income tax						
0.00	–	5.580	0.490	0.216	3.122	1.003
0.21	756K	5.622	0.489	0.200	3.100	1.000
0.40	756K	5.658	0.488	0.187	3.082	0.998
Net bequest model, changing labor income tax						
0.00	–	5.531	0.492	0.196	3.148	1.006
0.21	756K	5.622	0.489	0.192	3.100	1.000
0.40	756K	5.697	0.487	0.189	3.061	0.996

- Very similar effects on the aggregates with capital and labor income tax adjustments.

## Distributional effects, comparing capital and labor income tax

$\tau_b$	$x_b$	$\tau_a$	Gini	Percentile (%)			
				1	5	20	40
Net bequest model, changing capital income tax							
0.00	–	0.216	0.811	36.91	53.34	67.28	83.61
0.21	756K	0.200	0.804	35.15	51.90	66.09	82.89
0.40	756K	0.187	0.798	33.78	50.71	65.10	82.27
Net bequest model, changing labor income tax							
0.00	–	0.196	0.811	36.92	53.32	67.22	83.54
0.21	756K	0.192	0.804	35.15	51.90	66.09	82.89
0.40	756K	0.189	0.799	33.79	50.78	65.20	82.36

- Very similar effects on inequality with capital and labor income tax adjustments.

# Importance of parental background, comparing capital and labor income tax

Parent's earnings	Moving to parent's earnings		
	1st	2nd	3rd
<b>Benchmark</b>			
2nd	0.06	-	-
3rd	5.59	5.43	-
4th	<b>35.71</b>	35.50	28.41
<b>Net bequest model, changing capital tax</b>			
2nd	0.07	-	-
3rd	5.46	5.29	-
4th	<b>33.70</b>	33.52	26.73
<b>Net bequest model, changing labor tax</b>			
2nd	0.06	-	-
3rd	5.53	5.38	-
4th	<b>34.15</b>	33.98	27.12

- Very similar effects on the importance of parental background with capital and labor income tax adjustments.

## Welfare effects, going to year 2000 statutory estate tax

All	Initial Earnings				Fraction Gaining
	1st	2nd	3rd	4th	
<b>Partial equilibrium</b>					
Net bequest motive, capital income tax ↓					
0.015	0.004	0.027	0.134	-77.277	0.961
Net bequest motive, labor income tax ↓					
0.045	0.027	0.073	0.162	-89.250	0.990
<b>General equilibrium</b>					
Net bequest motive, capital income tax ↓					
0.005	-0.003	0.013	0.115	-75.100	0.384
Net bequest motive, labor income tax ↓					
0.020	0.009	0.035	0.111	-83.343	0.981

- GE: Cutting labor income tax is much better for most from a welfare standpoint.

## Aggregate effects, comparing net and gross bequest motives

$\tau_b$	$x_b$	$r$	wage	$\tau_a$	K	Y
Net bequest model, changing capital income tax						
0.00	–	5.580	0.490	0.216	3.122	1.003
0.21	756K	5.622	0.489	0.200	3.100	1.000
0.40	756K	5.658	0.488	0.187	3.082	0.998
Gross bequest model, changing capital income tax						
0.00	–	5.560	0.491	0.215	3.133	1.004
0.21	786K	5.622	0.489	0.200	3.100	1.000
0.40	786K	5.669	0.488	0.188	3.076	0.997

- Very similar effects on the aggregates with utility from net and gross bequests.

## Distributional effects, comparing net and gross bequest motives

$\tau_b$	$x_b$	$\tau_a$	Gini	Percentile (%)			
				1	5	20	40
Net bequest model, year 2000 statutory estate tax							
0.55	675K	0.174	0.794	32.99	49.98	64.43	81.74
Gross bequest model, year 2000 statutory estate tax							
0.55	675K	0.179	0.792	32.39	49.57	64.15	81.59

- Very similar effects on inequality with utility from net and gross bequests.

## Importance of parental background effects, comparing net and gross bequest motives

Parent's earnings	Moving to parent's earnings		
	1st	2nd	3rd
Benchmark			
Net bequest model, year 2000 statutory estate tax			
2nd	0.07	-	-
3rd	5.46	5.29	-
4th	33.70	33.52	26.73
Gross bequest model, year 2000 statutory estate tax			
2nd	0.07	-	-
3rd	5.43	5.27	-
4th	33.65	33.47	26.71

- Very similar effects on the importance of parental background with gross and net bequest models.

## Welfare Effects, going to year 2000 estate statutory taxation

All	Initial Earnings				Fraction Gaining
	1st	2nd	3rd	4th	
<b>General equilibrium</b>					
Net bequest motive, capital income tax ↓					
<b>0.005</b>	-0.003	0.013	0.115	-75.100	0.384
Net bequest motive, labor income tax ↓					
<b>0.020</b>	0.009	0.035	0.111	-83.343	0.981
Gross bequest motive, capital income tax ↓					
<b>-0.008</b>	-0.011	-0.008	0.070	-60.013	0.097
Gross bequest motive, labor income tax ↓					
<b>0.005</b>	-0.001	0.012	0.070	-67.207	0.457

- Rich people with wealth in the utility function lose less.
- Fraction gaining and overall welfare higher when labor tax is lowered as estate tax is increased.

## Comparison with the literature

- Models with completely altruistic agents: Cagetti and De Nardi (2009), Castañeda et al. (2003)
- Similar results: abolishing estate taxation leads to:
  - $\uparrow$  0.7 – 1.5% of aggregate capital
  - $\uparrow$  0.1 – 0.6% of aggregate output
  - $\uparrow$  1.0-1.7 percentage point in wealth by the richest 1%.

## Tax burden Effects, going to year 2000 statutory

Wealth Percentile	Age	Capital tax	Labor tax	Estate tax	Total tax
Benchmark					
0-1%	64.26	1.69	1.26	0.395	3.35
1-5%	61.80	0.21	0.31	0.001	0.53
Changing the capital income tax ↓					
0-1%	64.52	1.39	1.25	1.034	3.67
1-5%	61.70	0.19	0.31	0.006	0.51
Changing the labor income tax ↓					
0-1%	64.36	1.60	1.21	1.020	3.83
1-5%	61.79	0.22	0.30	0.006	0.52

- Estate tax revenue by the richest 1% increases substantially.
- Total tax increase as well, especially when adjusting labor tax.

# Conclusions

- Changing the estate tax rate, and in particular ↑
  - ↓ output and wealth.
  - ↓ inequality.
  - ↓ role of family background.
  - Welfare gains and benefits depend on tax used to balance the government budget constraint.
  - Aggregate, distributional, and parental background effects are very small, but the welfare effects from redistribution are large.
- Results surprisingly robust to bequest motive assumed + mechanisms driving wealth inequality.
