A General Equilibrium Model for Tax Policy Evaluation

CHARLES L. BALLARD, DON FULLERTON, JOHN B. SHOVEN, AND JOHN WHALLEY

Although market clearing prices have always been central to economic theory, an applied general equilibrium model in which prices simultaneously clear all markets is a relatively new development. Such large-scale models of entire national economies have proved useful in researching fiscal policy because they account for complex interrelationships among several segments of an economy and thus measure the widespread effects of a government's major economic decisions.

This book reports the authors' research on one of the most sophisticated general equilibrium models designed for tax policy analysis. Significantly disaggregated and incorporating the complete array of federal, state, and local taxes, the model represents the U.S. economy and tax system in a large computer package. The authors consider modifications of the tax system, including those being raised in current policy debates, such as consumption-based taxes and integration of the corporate and personal income tax systems. A counterfactual economy associated with each of these alternatives is generated, and the possible outcomes are compared.

The analyses that emerge from the model lead the authors to a number of conclusions that make this book especially relevant to the current concerns of policy makers and researchers. For example, the authors argue that substantial welfare gains for the economy could result from the integration of corporate and personal income taxes. They also show that tax rate increases would not lead to decreases in revenue for the U.S. economy, contrary to the so-called Laffer effect.

Relation of the Directors to the
Work and Publications of the
National Bureau of Economic Research

1. The object of the National Bureau of Economic Research is to ascertain and to present
to the public important economic facts and their interpretation in a scientific and impartial
manner. The Board of Directors is charged with the responsibility of ensuring that the work
of the National Bureau is carried on in strict conformity with this object.

2. The President of the National Bureau shall submit to the Board of Directors, or to its
Executive Committee, for their formal adoption all specific proposals for research to be
instituted.

3. No research report shall be published by the National Bureau until the President has
sent each member of the Board a notice that a manuscript is recommended for publication
and that in the President's opinion it is suitable for publication in accordance with the
principles of the National Bureau. Such notification will include an abstract or summary of
the manuscript's content and a response form for use by those Directors who desire a copy of
the manuscript for review. Each manuscript shall contain a summary drawing attention to
the nature and treatment of the problem studied, the character of the data and their
utilization in the report, and the main conclusions reached.

4. For each manuscript so submitted, a special committee of the Directors (including
Directors Emeriti) shall be appointed by majority agreement of the President and Vice
Presidents (or by the Executive Committee in case of inability to decide on the part of the
President and Vice Presidents), consisting of three Directors selected as nearly as may be
one from each general division of the Board. The names of the special manuscript commit-
tee shall be stated to each Director when notice of the proposed publication is submitted to
him. It shall be the duty of each member of the special manuscript committee to read the
manuscript. If each member of the manuscript committee signifies his approval within thirty
days of the transmittal of the manuscript, the report may be published. If at the end of that
period any member of the manuscript committee withholds his approval, the President shall
then notify each member of the Board, requesting approval or disapproval of publication,
and thirty days additional shall be granted for this purpose. The manuscript shall then not be
published unless at least a majority of the entire Board who shall have voted on the proposal
within the time fixed for the receipt of votes shall have approved.

5. No manuscript may be published, though approved by each member of the special
manuscript committee, until forty-five days have elapsed from the transmittal of the report
in manuscript form. The interval is allowed for the receipt of any memorandum of dissent or
reservation, together with a brief statement of his reasons, that any member may wish to
express; and such memorandum of dissent or reservation shall be published with the
manuscript if he so desires. Publication does not, however, imply that each member of the
Board has read the manuscript, or that either members of the Board in general or the special
committee have passed on its validity in every detail.

6. Publications of the National Bureau issued for informational purposes concerning the
work of the Bureau and its staff, or issued to inform the public of activities of Bureau staff,
and volumes issued as a result of various conferences involving the National Bureau shall
contain a specific disclaimer noting that such publication has not passed through the normal
review procedures required in this resolution. The Executive Committee of the Board is
charged with review of all such publications from time to time to ensure that they do not take
on the character of formal research reports of the National Bureau, requiring formal Board
approval.

7. Unless otherwise determined by the Board or exempted by the terms of paragraph 6, a
copy of this resolution shall be printed in each National Bureau publication.

(Resolution adopted October 25, 1926, as revised through September 30, 1974)

In economics, as in other fields, beliefs are reinforced or amended as successive researchers replicate or refute previous findings. For any particular contribution, the reader's confidence in the results depends fundamentally on his ability to reproduce them, regardless of whether he chooses to do so. When a large simulation model is summarized for the constrained space of a journal article, however, the reader may learn no more than the general approach of the model. The summary may be viewed as cryptic, and the model may be viewed as a black box. Confidence is accordingly limited. These considerations may have led Donald McCloskey to ask:

What is legitimate simulation? Between A. C. Harberger's modest little triangles of distortion and Jeffrey Williamson's immense multi-equation models of the American or Japanese economies since 1870 is a broad range. Economists have no vocabulary for criticizing any part of the range. They can deliver summary grunts of belief or disbelief but find it difficult to articulate their reasons in a disciplined way. (1983, p. 502)

The purpose of this book is to provide all of the equations, data, and procedures that would be required to replicate the findings of one such simulation model. This numerical general equilibrium model of the United States tax system has been used in a number of previous journal articles to evaluate a number of tax issues and proposed tax reforms, but its detail has not yet been made generally available. We hope that this detail on particular procedures, equations, and data will be useful to other researchers pursuing similar objectives, and we hope that its availability will increase confidence in these previously published results. This considerable modeling detail is preceded by a general discussion of tax
issues and methodology, and it is followed by updated results on the
issues addressed in several of the previous papers.

Since its beginning in 1976, work on various aspects of this model has
been supported by the Treasury Department's Office of Tax Analysis, by
several grants from the National Science Foundation, and by the National
Bureau of Economic Research. We are very grateful for this financial
assistance, as we are for data, suggestions, and other contributions of a
great many other researchers. Individuals at the Commerce Depart-
ment's National Income Division were particularly helpful. The model
originated with work for the Treasury Department, and it is still being
operated there, so it is sometimes known as the Treasury general equilib-
rium model. It is also known as GEMTAP, for general-equilibrium-
model taxation analysis package.

Some of the papers using this model have been coauthored by Charles
Becker, Antonio Borges, Shantayanan Devarajan, Roger H. Gordon,
Lawrence H. Goulder, Yolanda K. Henderson, Timothy J. Kehoe, A.
Thomas King, Andrew B. Lyon, and Richard A. Musgrave. Additional
research assistance has been provided by Thomas Kronmiller, Radwan
Shaban, and Janet Stotsky. All of these individuals have made substantial
contributions toward this book.

In addition to many seminar participants and anonymous referees, we
are grateful for suggestions made by Alan J. Auerbach, J. Gregory
Ballentine, Peter Baltaxe, Alan Blinder, George Borts, Miachel Boskin,
David F. Bradford, Peter Diamond, Larry Dildine, Daniel Feenberg,
Martin Feldstein, Harvey Galper, Mart Gertler, Malcolm Gillis, Ronald
E. Grieson, Robert E. Hall, Arnold C. Harberger, Glenn Harrison,
Robert H. Haveman, Charles R. Hulten, Dale W. Jorgenson, Michael
Kaufman, Wouter Keller, Jon Kesselman, Nicholas Kiefer, Mark Kil-
ingsworth, Larry Kimbell, Mervyn A. King, Laurence Kotlikoff, Arthur
B. Laffer, Charles McLure, Peter Mieszkowski, Hudson Milner, Franco
Modigliani, John R. Piggot, Sherman Robinson, Harvey S. Rosen, Her-
tbert Scarf, Jaime Serra-Puche, Joel Slemrod, Nicholas H. Stern, Wayne
Thirsk, and Norman B. Ture.

Successive versions of this manuscript were typed by Althea Chaballa
and Patrick Higgins. The long hours and outstanding work that they gave
to this project have made our tasks much easier.
