those doing further research. Thus, the importance of Cragg and Malkiel's conclusions and the very practical nature of the problem they address should make this volume highly valued by the investment community and academic researchers.

JOHN G. CRAGG is professor of economics and head of the Department of Economics at the University of British Columbia. Burton G. Malkiel is dean of the Yale School of Organization and Management and the William S. Beinecke Professor of Management Studies and professor of economics at Yale University.

A Rational Expectations Approach to Macroeconomics
Testing Policy Ineffectiveness and Efficient Markets Models
Frederic S. Mishkin
Mishkin pursues a rational expectations approach to the estimation of models that emphasize the effects of unanticipated movements in variables. He develops and discusses a unified theory of econometric treatment of these models, shows how to estimate them with an annotated computer program, and provides empirical studies that provide evidence on such important macroeconomic issues as the relation of monetary policy to both long- and short-term interest rates.

Risk and Capital Adequacy in Commercial Banks
Edited by Sherman J. Maisel
This collection offers a new approach to the problems of monitoring and controlling the probability and frequency of bank failures in the United States. It explains how risks in financial institutions arise, how they can be measured, and how they can be kept at a minimum. The authors argue that bank regulation and examination systems can provide more objective evaluations by using econometrics' quantitative tools for analyzing risk and assessing insurance premiums.

Rational Expectations and Economic Policy
Edited by Stanley Fischer
The papers in this volume fall roughly into two categories: those papers concerned with empirical or theoretical developments relevant to testing the theory of rational expectations and its implications for monetary policy and those more discursive papers dealing with government's "track record" as a controller of monetary aggregates.
"An important contribution . . . representative of the broadest spectrum of economic thinking with respect to weaknesses in current approaches to macroeconomic theory and policy."—Journal of Money, Credit, and Banking
