Subject Index

Biases: caused by misspecification, 117-28; in cross-sectional level regressions, 91; in spillover analyses, 261
Bonnen report, 363

Capital, knowledge: 20, 25-27; effect of outside, 28-29
Capital, physical: biases in estimates of, 118-19; defining and measuring, 106
Capital, R&D: biases in estimates of, 118-19; defining and measuring, 9, 25-33, 106, 108, 270; depreciation of, 27-28, 53-54; elasticity of output with respect to, 270; model of in production function, 270-81; in relation of R&D to productivity growth, 142-54. See also Investment, R&D

Computer price index: with adjusted TFP growth, 354-55; based on hedonic regression methods, 353-54
Creamer GNP improvement report, 363

Data: availability of micro and international, 367; constrain understanding, 348-49; disaggregation of BLS-IO and NSF data, 213; firm-level, 188; on growth of R&D capital stock, 142; input price, 261; level of aggregation, 263; multicollinearity in data series, 33-36; on patent rights, 308; quality for observation and measurement, 358-65; simultaneity in data series, 33-36; smoothing R&D series, 233-34; stock market valuation to assess patent value, 313-19; TFP and R&D in manufacturing sector, 234-39

Diffusion: curve or path of, 2; of innovations, 368; of new technology and knowledge, 1-2

Endogeneity: as source of misspecification, 273, 280-81; of technical change, 1-2, 8, 351, 368

Externalities: measurement of R&D, 252–53, 260–68; in “New” growth economics, 251; returns accruing outside firm’s returns, 52; as source of increasing returns and productivity growth, 255

Firms: business units as defined in PIMS data base, 135–36; data defining business units within, 134–36; differences across, 89–91; effects in econometric analysis, 89; partial productivity growth, 91–94; sample in analysis of productivity and R&D at firm level, 100–102, 106–8; size in relation to R&D, 68–72; treatment of mergers in sample, 113–17

Gibrat’s law of proportionate and independent growth, 171

Heterogeneity: differences in industry sectors, 108–9, 129–33; as source of misspecification, 273, 280–81

Industry: actual research in, 87; estimates of differences in sectors, 108–9, 129–33; measurement of output in research-intensive, 87. See also Manufacturing sector

Innovation diffusion, 368

Inputs: in analysis of returns to R&D, 20–22; R&D intensive, 30–31

Inventions: in analysis of returns to R&D, 24–25; components of production of, 356–57; formal R&D-based, 357–58; patents as indicators of, 356–58; represented by specific patent, 308–13

Investment, R&D: effect on TFP growth rate, 145t, 150t, 153–54; factors influencing, 19; with slowdown in productivity growth, 349–51. See also Capital, R&D

Knowledge: borrowed, 30–31, 38–39; diffusion and production of new, 1–2; measurement of externalities in, 366–67; in measurement of R&D capital, 25–33

Measurement: current framework for, 365–67; of impact of new ideas on research productivity, 252–54; of output and input, 19; problems of R&D capital, 31–33; of productivity, 367–68; of product-process mix effects, 146; quality of data for, 358–65; of social returns to R&D spending, 252–55; of technical change, 1–2

Misspecification: biases caused by, 117–28; endogeneity as source of, 273, 280–81; heterogeneity as source of, 273, 280–81; in production function estimates, 273; simultaneity as cause of, 33–35, 273; spillovers as source of, 273–74, 281

Multicollinearity: among R&D series, 261; problem of, 33–34

National Bureau of Economic Research (NBER), 5, 288

“New” growth theory, 7–8, 251, 366

Office of Technology Assessment report, 363

Output: in analysis of returns to R&D, 20–22; definition and scope of, 18; measurement in research-intensive industry, 22–25, 87; measurement of, 19; measures of R&D, 26–28

Patent rights: average value of, 308–13; data on, 308–9; granting of, 288–90

change, 321; numbers of applied for and granted (1970s), 349–50; relation to R&D activity, 301–8; renewals, 310; royalty potential, 310; sources of information about and in, 291–96, 319–21; stock market valuation of, 313–19; trends in applications and grants, 322–31

Production function: error term decomposition, 104–5; estimates in analysis of productivity and R&D at firm level, 117–27, 131–33; estimates in differentiated industry sectors, 108–9, 129–33; long- and short-term components, 144; model in analysis of returns to R&D, 20–22; in model of R&D and productivity relationship, 221–23; productivity in context of, 18; relation of R&D spending to productivity growth, 89–90

Productivity: analysis by industry sector of partial productivity growth, 93–94; analysis of firms’ partial productivity growth, 91–93; causes of slowdown, 163–68, 322; defined, 18; modeling relationship to R&D, 219–30; role of interindustry flows of R&D on growth of, 242–50. See also Total factor productivity (TFP)

Productivity transfers, interindustry, 30–31, 257–58

Quality change, 353

Rees productivity report, 363

Research: actual research in industry, 87; applied, 36; basic, 36–37; model of contribution to productivity growth, 52–55; need to measure and conceptualize, 43; private and social returns to, 87; productivity in relation to firm size, 68–71

Research and development (R&D): aggregated components of output, 26; borrowed, 38–39; changes in productivity over time, 151–54; company-financed, 69–71, 73, 82–83, 91–93, 96; comparison of relation to productivity growth in Japan and United States, 200–208; contribution to growth, 18–19; contribution to production, 9; decay of potency, 151, 153–54; declining patent-R&D ratios, 355–56; differential between social and private returns to, 355; effects on costs, prices, and profits, 155; empirical analysis of relation to productivity growth, 142–54; federally financed, 68–70, 72–73, 86, 91, 93, 96; in generation of productivity growth, 88; inferring contribution to productivity growth, 219–21; interindustry flows of, 241–50; mix between product and process, 154–55; model of relationship to productivity, 219–30; model of TFP growth related to R&D capital stock, 221–31; NSF data, 214–15; NSF R&D-Census match data, 82–86, 88–89; process-oriented, 243, 245, 248–50; product-oriented, 243, 245, 248; publicly and privately financed, 36–38; relation of patents to activity in, 301–8; relation to firm size, 68–71; returns to R&D and R&D spillovers, 264–65; role in French and U.S. productivity growth, 168–69; spillover and direct effects of government-financed, 36, 38; stock market valuation of, 313–19; studies estimating returns to, 39–41, 264; tracing measured effects of, 9. See also Externalities; Spillovers, R&D

Residuals: accounting for observed, 351; looking for correlations among, 262; output growth attributed to, 2; yielded by economic models, 2

Returns: data sources used in analysis of, 20–21, 41–42; differential between social and private returns to R&D, 355; input and output in returns to R&D, 20–22; to R&D and R&D spillovers, 264–65; to R&D expenditures, 59–68, 74–77, 252–55; to research, 87; studies estimating returns to R&D, 39–41, 264, 269–70

Ruggles report, 363

Simultaneity: in analysis of R&D contributions to productivity growth, 104–5, 128; solutions to problem of, 274–80; as source of misspecification, 33–35, 273

Specialization, 25
Specification, 117–28. See also Misspecification

Spillovers: approaches to construction of stocks or pools, 258–61; measurement of, 260–68; model of within-industry effects of, 28–29; in “New” growth economics, 251; as source of misspecification, 273–74, 281

Spillovers, R&D: effects of government-financed, 36, 38; estimating, 8; as ideas borrowed by research teams, 258; identification and measurement of, 30–31, 319; importance of, 7–8; as inputs purchased from other industries, 257–58; model of within-industry effects, 256

Stigler committee, 353, 363

Technical change: in analysis of productivity and R&D at firm level, 106–12; endogenous, 1–2, 8, 351, 368; external, 87; knowledge spillovers in, 7–8; measurement of, 1; in “New” growth economics, 251; output growth attributed to, 2; patents as indicators of, 321, 328–30, 334–36; as source of growth, 1

Technology: diffusion of new, 1–2; firm-specific variations in, 143; patents as measure of shift in, 328; role of interindustry flows in productivity growth, 241–42, 244–50

TFP. See Total factor productivity (TFP)

Tornqvist indexes, 216–17, 231

Books of Related Interest

R&D, Patents, and Productivity
Edited by Zvi Griliches
The groundbreaking work in this volume explores the relationship between research and development (R&D) and its subsequent impact on technology and economic performance. Major findings include documentation of a significant relationship between R&D expenditures and subsequent growth in productivity, the usefulness of patents as an indicator of inventive activity, and the relative unimportance of R&D in accounting for the recent worldwide slowdown in the growth of productivity.
An NBER Project Report

Output Measurement in the Service Sectors
Edited by Zvi Griliches
In this volume, leading experts from government and academia suggest that current measurement methodology may be underestimating the contribution of services to productivity growth in the economy as a whole. The contributors look at the consumer price index, labor productivity indexes, wholesale and retail trade, the stock market, banking, education, day care, and transportation.
NBER Studies in Income and Wealth, Volume 56

The Economics of New Goods
Edited by Timothy F. Bresnahan and Robert J. Gordon
New goods are at the heart of economic progress. But the value created by new goods must somehow be converted into an exact quantitative measurement if official data on inflation, such as the consumer price index, are to represent accurately the theoretical concept of a true "cost-of-living" index. The eleven essays in this volume include historical treatments of new goods and their diffusion; practical exercises in measurement addressed to recent and ongoing innovations; and real-world methods of devising quantitative adjustments for quality change.
