Section 1

An Explanation in General Terms

The figures in the text tables are of two types, original or primary entries and postings or secondary entries. By a secondary entry is meant one for which the source (as given in the source column or in a footnote) is another text table. Other entries are primary entries. Most of the lines in the eleven sector statements of payments and balances, in the synopsis of GNP expenditures and other moneyflows (Table 33), and in the analysis of bank credit (Table 41) carry original entries. Most of the figures in the seventeen national account tables and in Tables 1, 2, 3, 17, 30, 39, and 42 are secondary entries.

Each national account is a recapitulation made by selecting the appropriate debit item and the appropriate credit item from each statement of payments and balances. In these national accounts the source column gives for each entry the text table and line on which the primary entry is recorded. When, as in Table 42, a secondary entry is a simple computation from two or more original entries, the sources and methods of computation are indicated in the text, in a footnote, or in the source column.

For a few primary entries the sources and methods are given immediately in footnotes to the text tables. But in most instances the source reference for a primary entry specifies a line on one of the following pages. Except for

items pertaining to the Federal government, such source references are to pages in Section 2 of this Appendix. Sources and methods for Federal government items were explained in Technical Paper 5. ^{1/} For the reader's convenience nineteen pages from the appendix to that paper are reprinted here as Appendix B.

Most source references are given in symbolic form. Each symbolic reference consists of a catalogue number identifying the table or page on which the source is to be found plus a letter identifying the line. These symbolic references are of three types:

- 1 Secondary entry source references to other text tables. The catalogue number in each such case is P&B followed by a roman numeral (indicating that the reference is to a statement of payments and balances and giving the number of the transector group) followed by a letter (showing the line on this statement). For example, P&B I A means line A of the households statement.
- 2 Primary entry source references to Section 2 of this Appendix (catalogue numbers HH 101 through BL 104). Thus the source reference for line C of Table 18 is HH 101 G, i.e., line G, on the page carrying catalogue number HH 101. The serial number of each such page can readily be found by referring to the Contents for this Appendix.
- 3 Primary entry source references to Appendix B (catalogue numbers 101 through 105). The statement of payments and balances for the Federal government is derived by consolidating five separate statements, one covering the general fund operations, three covering social insurance funds, and one miscellaneous Federal funds, Tables 101 through 105. Thus the reference for Federal payroll expenditures in Table 19 is 101 P + Q, i.e., Table 101 in Appendix B, line P + line Q.

^{1/}Concerning a New Federal Financial Statement. Morris A. Copeland, National Bureau of Economic Research, December 1947.

To indicate the sources and methods of estimate the pages in Section 2 and fourteen of the pages in Appendix B have been cast in the form of illustrative worksheets. These worksheets too carry a source column. Some entries in this column are to other publications, some to other sample worksheets, and some to Section 3 of this Appendix. References to other publications are frequently to secondary materials, e.g., the Statistical Abstract. Since one objective of this exploratory study was to tie moneyflows estimates to standard series when possible, it did not seem especially advantageous to attempt to go to original sources; in any case, such documentation would not have been feasible within the limits of this study.

References in Section 2 to other sample worksheets in that section conform to the pattern already explained, a catalogue number followed by a letter indicating the line on the sheet. A similar pattern is followed in references to Appendix B. The sample worksheets in Appendix B are numbered A-1, A-2, etc. through E-6. References to these sheets in Section 2 read App. B, Worksheet A-1; App. B, Worksheet E-6; etc. References to Section 3 of this Appendix simply give the subsection number, e.g., App. A 3 vi.

On each sample worksheet in Section 2 the method of computation and the sources of the basic data are shown for a

sample year for each moneyflow item. Loanfund computations are shown for two successive year-ends. Computations and sources are shown on the worksheets in all cases for 1939, and in certain cases for 1938 or 1940 also. The rules followed in presenting sample-year calculations are:

Most moneyflow figures are shown only for 1939. For the rest of the world moneyflow figures are shown also for 1940 in order to relate the new and old Department of Commerce balance of payments computations to the moneyflows account for this sector.

For all transactor groups most year-end figures as of June 30 and as of December 31 are shown for both 1938 and 1939. For the rest of the world December 31 figures are shown also for 1940. In Section 2 xii, Analyzing Bank Credit by Obligor, December 31 figures are shown only for 1939.

Where the derivation is relatively simple, e.g., for households gross cash pay expenditures (HH 201 A et seq.), the entire derivation for the sample year (or two dates) will be found on the page indicated in the source column of the text table. In some cases, e.g., the corresponding item for business proprietors and partnerships et al, PP 201 A, the derivation is sufficiently complex to call for supporting worksheets. In Appendix B there are supporting sample worksheets for each of the five main tables.

Although an attempt was made to use regularly published series so far as feasible, it was very often necessary to make an independent estimate of an item or a component of an item. Where sufficient basic data were available the method

of estimate ordinarily adopted was the method of variable weight ratios. We may outline this method as follows: Let Y_{vj} be the attribute of a universe to be determined, and y_{vj} the corresponding attribute of a sample, the subscript vj indicating the year. Let X_{vj} be another attribute of the universe and x_{vj} the corresponding attribute of the sample. Where y_{vj} , X_{vj} , and x_{vj} are known for the various values of v , Y_{vj} is determined by the formula $Y_{vj} = y_{vj} \frac{X_{vj}}{x_{vj}}$. The variable weight ratio is $\frac{X_{vj}}{x_{vj}}$. In estimating the interest received by non-insured commercial banks, the (variable weight) ratio of loans and securities held by noninsured commercial banks to loans and securities held by insured commercial banks was applied to the interest received by the insured banks. See BK 101 B through F.

The information available was often insufficient to permit use of a variable weight ratio. The alternative method most commonly employed follows the aggregative index number pattern. For each item estimated on this pattern an indicator series was first selected: a sample series, a series that covers most of the items except for minor omissions, a total to be allocated between other transactors and the transactor group to which the item applies, or some other series believed to indicate the year-to-year movements in the item to be estimated. The item was next estimated for one year. On the basis of this estimate and the value of

the indicator series for the year, a constant weight ratio was then determined. Finally, each year of the indicator series was multiplied by this weight ratio to give the annual estimates for the item. Thus household expenditures a/c instalments to contractors for residential repairs were computed as 27.2 percent of the value of this type of construction activity as estimated by the Department of Commerce. See HH 201 M and O.

Where a variable weight ratio was used, separate lines appear on the sample worksheets showing the ratio and its derivation. Where a constant weight ratio was used, only two lines appear on the sample worksheet for the computation -- one for the indicator series and one for the product of the indicator series by the weight ratio. Some of the constant weight ratios applied to indicator series are explained in footnotes on the sample worksheets. Notes explaining the other constant weight ratios appear in Section 3 of this Appendix.

In many instances where the constant weight ratio procedure was followed, no single appropriate indicator series was available covering all seven years on a comparable basis. Hence, splicing was necessarily often resorted to, and sometimes with no satisfactory overlap year. The sample-year computations given in the following pages therefore cannot

be taken as specifying fully the sources and methods of computation for other years. However, the more important splicing problems are indicated in footnotes.

While a great many items and components were estimated by some form either of the variable or of the constant weight ratio procedure, these two do not cover all cases. One other procedure may be mentioned. Several balance sheet items were determined by estimating separately the annual increments and the approximate absolute magnitude of the balance as of some one date, and then computing the balances for other dates. One 1939 balance estimate made in this way, that for the main component of household portfolios, is explained briefly in Section 3; corresponding explanations in other instances where this method was followed are carried in footnotes on the sample worksheets.

Partly because of the publication of new data and of estimates by other workers while this inquiry was in process, most of the estimates presented here are revisions or re-revisions of earlier ones. However, when an inquiry is concerned, as this is, with setting up a complicated system of social accounts there is an additional urge to revise and re-revise. The definitions of the various items must articulate, and the several methods of estimate must be reasonably consistent. But until a full first round of estimates has been

completed, it is scarcely possible to foresee the kinds of conflict in definition and in method that may arise. And a second round designed to eliminate the conflicts revealed by the first may bring new ones to light. At the same time the consistency requirement imposed by a system of social accounts does not work unambiguously in the direction of revisions. Changing one procedure may carry with it the necessity for changing others, so that one shortly acquires a vested interest in a given plan of worksheet layouts. The most glaring conflicts and inconsistencies of earlier rounds of estimates have been eliminated from the procedures outlined in Sections 2 and 3 and Appendix B. But minor difficulties remain. A more thoroughgoing redesign of worksheet layouts than was possible in this exploratory study would be required to get rid of these remaining difficulties.

The estimates published by other workers while the money-flows accounts were being developed often represented a better knowledge and a more detailed use of basic sources than were available to or feasible within the limits of this study. An effort was made to incorporate such estimates as revisions or to use them as a basis for revisions, wherever the resulting improvement was sufficient to warrant it. But it was necessary to close the books to minor revisions before a final blanket book-closing date was enforced. There are various instances in which the substitution of estimates published by

others would have made very little difference. In a number of cases where the difference lay within the rounding error for 1939 and was not materially greater in other years, the published estimate is given as the source in the following sample worksheets, although the slightly differing earlier estimate has been retained in the unrounded computations from which the text tables are drawn. There would appear to be no serious objection to this procedure, and it substantially simplifies the explanation of sources and methods of estimate.

In any event the sample worksheets are not to be taken as indicating the precise lines and line arrangements of the actual worksheets. Numerous rearrangements have been introduced to bring out more clearly the reasoning underlying the procedures employed. Further, some lines that must be repeated on operating worksheets to facilitate accurate computations have not been repeated here, while some lines not necessary on operating worksheets have been included in Section 2.

Most of the figures on the sample worksheets are in millions of dollars; whenever a figure is not in millions of dollars it is enclosed in parentheses and its denomination is indicated in the stub.

A somewhat flexible rule for rounding was followed in the text tables. To avoid obscuring the year-to-year movements

of smaller series and the implications of a high degree of precision in the larger series, the latter were rounded to the nearest \$100 million, and the smaller ones to the nearest \$50, \$20, or \$10 million.

For the reader's convenience a selected list of the sources most frequently cited and a glossary of the abbreviations used in the illustrative worksheets are presented in Section 4.

No sample worksheets for the derivation of Table 37 are included in this Appendix. In connection with this table the writer asks the reader's cooperation in an experiment. The nature of this experiment is indicated in Chapter 10, Section 3. Two questions are there posed. If material significance attaches to estimates of technical transactions it should be possible to answer one or both of these questions without knowledge of the sources and methods employed in preparing Table 37. The writer believes that the answers made without such knowledge are likely to be a better test of the potential significance of estimates of technical transactions than answers made with such knowledge. And he desires to arrange such a test. Accordingly he offers to send a statement of sources and methods to any reader who requests the statement, provided the request is accompanied by a reasonably conscientious attempt to answer one or both of the two questions posed in Chapter 10, Section 3.

As was noted in the text, only two of the fourteen national moneyflow accounts show a discrepancy. In each of the other twelve accounts some entry is a residual estimate, or else two or more of the items represent an apportionment of the net accounting balance of all others.

This is one reason why the discrepancies can not properly be taken at face value as indicating the magnitudes of errors of estimate. But there are other reasons too. A discrepancy that appears in one account might conceivably be shifted in part or entirely to other accounts, if we had more information. Furthermore a small discrepancy may be the net result of a material debit error and a largely offsetting credit error.

For important areas of moneyflows and loanfunds our knowledge is extremely sketchy and our estimates are very shaky: household portfolios, net owner takeouts, real estate transfers, and most of the items in the statements for business proprietors and partnerships et al and security and realty firms et al. Moreover, many items in other areas have been estimated by extremely rough procedures either because data were not considered good enough to warrant anything more meticulous or because the additional labor that would have been involved was taken to be subject to sharply diminishing returns in greater precision.

1/For dates before December 31, 1939 no separate estimates were made for lines C, D, and G. Line H was computed as follows. An indicator series was obtained from S. Shapiro's estimate of currency and deposit holdings of individuals, nonprofit organizations, noncorporate agriculture and public utilities, etc. ("The Distribution of Deposits and Currency in the U. S. 1929-39," Journal of the American Statistical Association, December 1943, p. 441) cash balances of farmers, nonprofit organizations, and noncorporate public utilities (AG 301 G + PP 301 G + a rough estimate of the public utility component of PP 301 B). This indicator series was multiplied by a constant weight ratio (34,938 ÷ the value of the indicator series for December 31, 1929).

1/ From 1930 to 1940, urban population increased 7.9% (Statistical Abstract 1944, Table 10). Urban land area has been estimated as amounting to 13 million acres in 1940 (estimate furnished by L. A. Bureau of Agricultural Economics). Assuming a proportionate increase in urban land areas over the period, the total transfer of rural land to urban use would amount to 960 thousand acres, or an annual transfer of 96 thousand acres. At an approximate price of \$1 thousand per acre, the value of the transfers would amount to about \$100 million. In each of the three years 1940-1942 it was assumed that an additional \$100 million was received by Farms from sales of land to the Federal Government. For government purchases see Text Table 11.

1/For dates before December 31, 1939, this item was estimated by extrapolating the BAE series on farmer-owned demand deposits by the 1939 ratio of demand deposits at country banks in places with population under 15,000 to farmer-owned demand deposits.

2/For dates before December 31, 1939, the 1939 ratio was used.

3/For dates before December 31, 1939 line K was estimated by multiplying account receivable of six major farm equipment producers (Industrial Securities 1939, Moody) by the 1939 weight ratio, i.e., the ratio of line K to this series as of December 31, 1939.

T Corp. sales, constr. contractors (To R&B III E)	2,208	Survey of Current Business Apr. 1946, p. 19 T

1/The classification nonfinancial corporations includes all corporations filing federal income tax returns except lessors of real property and finance, insurance, and real estate corporations. This classification is identical with the transactor group Industrial Corporations except that it includes incorporated farms.

2/The Commerce Department estimate entitled farms apparently includes gross sales and gross receipts from operations (Statistics of Income 1929, Pt. 2, Table 3, lines 2 and 3) by transactors in Standard Industrial Classification major group 07, agricultural and similar service establishments.

3/Tips and other gratuities given employees of Industrial Corporations and Business Proprietors and Partnerships et al are treated as receipts from customers for these transactor groups since the total gross cash pay (expenses) paid by these transactor groups to households includes the value of tips and other gratuities.

1/Sales of residential property for nonresidential use are estimated to have averaged around \$200 million per year during 1936-1940 (See App. A 3 ix). Net annual expenditures for acquisition of real estate by Industrial Corporations were assumed to be one-half the amount.

2/This weight ratio is the ratio of estimated instalments to contractors based on adjusted 1939 Census of Construction data to the 1939 estimates of construction activity in the United States (Special Release, May 1944), U. S. Department of Commerce. For the weight ratios see App. A 3 ix. Revised Commerce Department estimates of construction activity became available too late for inclusion in this study.

3/See APP. A 3 ix.

^{1/}See IC 301 N for variable weight ratio.

^{2/}Year-to-year changes in line A (based on Bureau of Internal Revenue data) appear to be distorted by various changes in method of compilation. Therefore the estimate for all Industrial Corporations (line D) is based on a blow-up of the series on notes and funded debt payable for the sample of nonfinancial corporations. The constant weight ratio 1.21 is the average of 1936-1942 ratios on line C.

^{3/}See footnote 2/ to IC 301.

^{4/}Includes telegraph, cable, and radio telegraph carriers.

^{5/}See footnote 1/ to IC 301.

^{6/}See footnote 4/ to IC 301.

^{7/}Includes class I line-haul railways and class I switching and terminal companies.

1/This weight ratio is the ratio of business proprietors and partnerships et al estimated operating revenue to total wholesale sales in 1939. For ratios see App. A 3 iii. The Department of Commerce has recently made an extensive revision of its annual estimates of wholesale sales.

The new estimates exclude manufacturers' sales (sales by manufacturers' branches and offices, etc.). These new estimates are on a moneyflows basis, but they did not become available in time for inclusion in this study.

2/Includes plumbing and heating equipment, lumber and millwork, other building materials and building metal work.

3/Includes tobacco and products (except leaf).

4/This weight ratio is the ratio of business proprietors and partnerships et al estimated operating revenue to total retail sales in 1939. For ratios see App. A 3 iii.

	Cost of goods sold	1,920	U x (IC 231 R) 1/

1/The variable weight ratios from IC 231 are ratios of cost of goods sold by corporations to corporate gross sales. Such a ratio was computed from data in Statistics of Income for each retail group for each year, 1938-1942. The necessary data are not available for prior years; hence the averages of the 1938 and 1939 ratios was used in this estimates for 1936 and 1937.

2/The weight ratio applied to line 0 was computed from data that do not include jewelry retailers. The weight ratio applied to line G on PP 212 was from data that include jewelry retailers.

U This citation refers to an unpublished Federal Reserve memorandum (R&S 1147 Revised) issued December 1945.				T
V Excludes nonprofit organizations.				
W The constant weight ratio used on line B for December 31, 1939 through 1942 is the ratio of estimated nonfinancial demand deposits to all noncorporate business demand deposits on July 31, 1944 (Federal Reserve Bulletin, November 1944, p. 1072). For dates before December 31, 1939, line B was estimated by (1) applying the ratio of noncorporate to corporate operating revenue, by industry group, to the currency and deposit holdings of Industrial Corporations December 31, 1935 through December 31, 1939, and (2) splicing the two series at the end of 1939.				
X Estimated for dates before 1939 by adjusting receipts from contributions by the 1939 ratio of receipts to cash holdings.				
Y The 1939 ratio was applied in all earlier years.				
Z Holdings of Federal Government obligations by nonprofit organizations for dates before December 31, 1939 were assumed to be the same as at the end of 1939.				
AA The distribution of portfolios of endowment funds is based on an analysis of a sample of the endowments for which investment data were reported in G. Seybold's <u>American Foundations</u> , 1942.

1/Loans and securities plus cash as of December 31, 1936 were estimated as approximately five-thirds of "Funds of Self-Administered Pension Plans for which Information was Reported" as of December 31, 1936 (Latimer and Tufel), Trends in Industrial Pension 1940, p. 79 or \$970 million.

2/Insurance companies n.e.c. are chiefly title and mortgage guarantee institutions. The weight ratios applied to gross cash pay of Other Insurance Carriers to give annual estimates of receipts from customers and of other financial statements items for this subgroup were derived from crude 1939 estimates. There were three principal bases employed in arriving at these crude 1939 figures: (a) the figures for total assets and total premiums plus fees of title and mortgage guarantee companies as shown in the 1939 New York Insurance Report Vol. III, (b) a rough analysis of reports for several individual carriers, and (c) the guess that title and mortgage companies operating in New York State represented about 7% to 10% of all insurance carriers not elsewhere included in the estimates of payments and balances for Group IX.

V For dates before December 31, 1939 this item was estimated by adding a constant to S. Shapiro's estimate of noncorporate security dealers' holdings of deposits and currency. See "The Distribution of Deposits and Currency in the United States, 1929-1939," Journal of the American Statistical Association, December 1943, p. 441. The constant added equals the difference between Shapiro's series for December 31, 1939 and the estimate for that date as on line C above.

W For dates before December 31, 1939 this item was estimated by multiplying Shapiro's estimate of deposits and currency held by financial corporations other than insurance carriers by a 1939 weight ratio. This weight ratio equals the ratio of the figure on line D for December 31, 1939 to Shapiro's estimate of holdings on that date.

X For dates before December 31, 1939 this item is assumed to be the same as 1939.
Y Includes security and commodity-exchange brokers and dealers.

1/

Includes security and commodity-exchange brokers and dealers.

2/See footnote 2/ to SR 102 for a listing of the industry groups included in this classification.

3/This item was estimated for dates before December 31, 1939 on the basis of data in the Survey of American Listed Corporations 1935-1939, Securities and Exchange Commission.

4/Includes investment trusts and investment companies, holding companies, and other corporations holding securities.

5/Because of year-to-year revisions in the composition of the Bureau of Internal Revenue classification of holding companies, Statistics of Income data on investments held by this group were not used. Instead this item was estimated by adding to bonds, notes, and mortgages payable by investment trusts and holding companies (line 1) a constant of \$24 billion to correct the level. This constant is the approximate difference between line 1 and total receivables and investments other than Federal Government obligations held by investment trusts and holding companies reported in Statistics of Income as of December 31, 1939.

S	Other debts paybl., Sec. & R. Firms et al	32,050	31,832	M + R

1/This item includes deposits, investment certificates, borrowed money and loans in process.
2/This classification includes all industry groups listed in footnote 1/ to SR 101, except that line F excludes security and commodity-exchange brokers and dealers and line Q excludes in addition investment trusts and investment companies, holding companies, and other corporations holding securities.

3/Includes security and commodity-exchange brokers and dealers.

4/See footnote 4/ to SR 302 for a listing of the industry groups included in this classification.

5/This item was estimated for dates before December 31, 1929 on the basis of data in the Survey of American Listed Corporations 1925-1929, Securities and Exchange Commission.

D	New pd.-in capital, corp. Sec. & R. Firms et al ^{1/}		+264	B minus C ^{2/}
E	Est. pd.-in capital, corp. Sec. & R. Firms et al ^{1/}	33,351	33,615	Est. as cumulative of D with 1936 set at \$33 1/3 billion ^{2/}
F	Sys. & loan assns., pd.-in capital	4,005	4,060	Files, Fed. Home Loan Bank Adm.
G	Total pd.-in capital, corp. Sec. & R. Firms et al (To P&B X h)	37,356	37,675	E + F
H	Total Loanfunds Payable (To P&B X 1)	69,684	69,807	(SR 302 O) + (SR 303 S) + (SR 304 G)
I	Valuation Losses Net		+ 202	(BK 303 M) + (LI 301 I) + (OI 304 R)
J	Est. net valuation losses, Sec. & R. Firms et al (To P&B X m)		+ 101	Est. as I x (50%)

^{1/}This classification includes all industry groups listed in footnote 1/ to SR 101 except investment trusts and investment companies, holding companies, other corporations holding securities, and insurance agents. Year-to-year changes in Statistics of Income data on proprietors' equity in investment trusts and holding companies apparently reflect changes in industrial classification to such an extent that actual changes in equity are obscured. Data for such corporations have therefore been omitted from line A through line D but an estimated average equity for investment trusts and holding companies has been included in line E. Insurance agents were similarly excluded in the compilation of line D, since they were not shown separately in Statistics of Income until 1941 and since their inclusion would have made little difference. Thus investment trusts and holding companies and insurance agents affect the level but not the year-to-year movements of E. ^{2/}The data in the Bureau of Internal Revenue Source Book for years prior to 1938 refer to a materially different group of corporations (defined in terms of the Bureau's old industrial classification). Consequently it was necessary to make an arbitrary guess for new paid-in capital (line D) for 1938 in order to splice the old and the new Bureau of Internal Revenue series.

^{3/}Compiled net profit after taxes minus cash dividends.

^{4/}It was arbitrarily assumed that paid-in capital December 31, 1926 was \$33 1/3 billion.

E Total Ordinary Receipts (To R&B XI J)	3,582	3,898	(RW 101 C + F + U) + (RW 102 D)

1/This represents income from investments classed in the Department of Commerce category "direct investments"; see The United States in the World Economy, pp. 100-105.

2/This is referred to hereafter as Intl. Trans. of U. S. All data for years before 1940 are from The United States in the World Economy, U. S. Department of Commerce, Appendix Tables I, II, and III.

3/Income from portfolio investments has been allocated as follows: 90 percent dividends, 10 percent interest.

4/These items are included in merchandise imports and exports in the current computation of the balance of payments by the Department of Commerce.

5/The current balance of payments computation includes in United States merchandise imports the net United States nonmonetary consumption of gold. Net nonmonetary consumption is defined as domestic gold production minus domestic gold consumption for nonmonetary purposes when this difference is greater than zero. For each of the years under study, 1936 through 1942, domestic gold production exceeded domestic nonmonetary consumption and the net domestic gold consumption component of line H on RW 101 was taken as zero. For years in which domestic production exceeds nonmonetary consumption, the excess is included in United States merchandise exports (see RW 201 J).

6/This item was assumed to be a customer moneyflow. Detailed information on its composition was obtained too late to permit a reclassification in this study. Its principal components are public purpose payments and tax refunds.

W Total ordinary expd.	122,912	(GNP 105 R) + (GNP 106 K + R) = IC 203 I

1/ Revised Department of Commerce estimates of construction expenditure estimates (from the Survey of Current Business, July 1947 Supplement) are used here, although earlier estimates were the basis of the figures in the Statements of payments and balances. The most significant of the revisions is the treatment of GNP 105 line A above as a new construction expenditure. It is believed that this item is included in the estimates of total ordinary expenditures by Industrial Corporations and Business Proprietors and Partnerships, and that the inclusion of the revisions of other construction expenditure estimates here does not greatly affect the results.

P Total ordinary expd.	10,231	(GNP 111 Q + d) + (GNP 112 Q) cf. Tbl. 19 Y
2/Changes in government quasi-business inventories were assumed negligible prior to 1940. During 1940-1942 only inventories of war corporations were considered significant.		
2/This estimate of GNP expenditures differs from that presented in Technical Paper No. 5 (referred to in Section 2 above), because an attempt has here been made to conform to the revised Department of Commerce concept of gross national product. The principal differences between GNP 111 Q above and Table 5 in Technical Paper No. 5 are the exclusion of interest originating in government and government subsidies.		
3/This item includes employer contributions for Federal unemployment tax, railroad unemployment insurance, railroad retirement insurance, and old age and survivor insurance plus employee contributions to the last two of these categories.

Section 3

Some of the More Involved Estimating
Procedures for 1939

i Payrolls and Operating Revenues of Manufacturing Enterprises

Annual estimates of total payrolls and of corporate operating revenues are available for nineteen industry groups of manufacturing units. For purposes of allocating payrolls between industrial corporations and business proprietors and partnerships et al, and of estimating the operating revenues of noncorporate enterprises these manufactures series were combined into three broad subgroups. The constant weight ratios used in making the allocations and the operating revenues estimates were derived from estimates of the corporate payrolls and the noncorporate operating revenues of each of the three subgroups in 1939.

For each subgroup corporate payroll was estimated as the sum of four components (a) officers' salaries as reported in Statistics of Income, (b) payrolls for manufacturing wage earners, (c) payrolls of central office employees, and (d) other payroll of manufacturing establishments. Census figures for (b) and (d) are not detailed by type of legal organization. Corporate figures for (b) were estimated by prorating on the number of corporate and noncorporate wage earners; such figures for (d) were estimated by prorating on value added in manufacturing. The 1939 Census did not cover central offices. The 1937 total figure for central offices was apportioned among the three groups by prorating on the sum of

(a), (b), and (d).

Noncorporate payroll for each of the three subgroups was estimated by deducting the corporate estimate from the total as estimated by the Department of Commerce. Payroll of nonecorporate establishments covered by the Census was similarly estimated by subtraction. For each group the resulting total-to-Census payroll ratio was applied to the Census figure on noncorporate value of products to obtain an estimate of noncorporate operating revenue.

These computations and the computations of the constant weight ratios used in making estimates for years other than 1939 are set forth in Table A.

Line L was estimated by prorating total of \$274 million on line K. Total was assumed to be the same as in 1937 (Biennial Census, Manufactures: 1937, Pt. I, p. 1652).

Line N, Survey of Current Business, July 1947 Supplement, p. 27.

Line V, Same Journal, April 1946, p. 19.

1/Includes iron and steel, nonferrous metals, machinery, nonautomotive transportation, and automobile industries.

2/Includes textile, apparel, lumber, furniture, paper, chemical, petroleum, rubber, leather, stone, and miscellaneous industries.

3/This is a crosstotal.

4/Includes manufacturing salaries and payroll for distribution, construction, and "other".

ii Payrolls and Operating Revenues of Wholesale Firms

The Department of Commerce has made annual estimates of total wholesale payrolls and of wholesale sales by major kinds of business.^{1/} Constant weight ratios were applied to these series to apportion payrolls between corporate and noncorporate firms and to estimate noncorporate operating revenues.

For noncorporate wholesale enterprises crude estimates of receipts from customers (operating revenues) and gross cash pay for 1939 were made for seven subgroups. As in the case of other broad industrial groupings, particularly mining and mineral extraction and manufacturing, no attempt was made to adjust the establishment estimates of payrolls made by the Department of Commerce to an ownership basis; but the estimates of operating revenues are necessarily on an ownership basis. Therefore the total wholesale payroll estimate (corporate plus noncorporate) for 1939 is slightly larger than that reported in the 1939 Census (\$2,791 million as compared to \$2,624 million; the difference represents omissions); the total operating revenue estimate is very much smaller than the Census total for wholesale sales (\$28.8

^{1/} The Department of Commerce has recently made an extensive revision of its annual estimates of wholesale sales. The new estimates exclude manufacturers' sales (sales by manufacturers' branches and offices, etc.); thus these new estimates represent what is here called operating revenues of wholesalers. But they did not become available in time for inclusion in this study.

billion as compared to \$55.3 billion). The two principal factors accounting for the difference between wholesale sales and the operating revenues of wholesalers are that wholesale sales include sales of branch offices of manufacturing concerns and that they include sales by agents on commission. Operating revenues of wholesalers are here assumed to equal sales by principals that are classed as wholesalers plus commissions of wholesale agents.

1939 operating revenues of noncorporate wholesalers were estimated as follows:

Table B
Estimated Operating Revenues of
Noncorporate Wholesalers

	<u>Sales</u> <u>(1)</u>	<u>Closing Inventory</u> <u>(2)</u>
A Service and limited function wholesalers	6,196	623
B Agents and brokers	278 1/	28
C Assemblers	885 1/	89
D Subtotal	7,359	
E Omissions, etc.	221 2/	
F Estimated total operating revenue	7,580	

1/ Col. 1 ÷ col. 2 assumed the same as on line A.

2/ 3% of D.

For corporate wholesalers the Department of Commerce estimate, Survey of Current Business, April 1946, p. 19, based on corporation income tax returns was used.

In the case of payrolls the Census total was accepted for corporations; noncorporate payrolls were estimated by subtracting this total from the Department of Commerce estimate for all wholesale establishments. Omissions were thus assumed to be entirely noncorporate.

More careful revenue and payroll estimates for 1939 did not seem feasible because the Census does not provide a detailed bench mark for noncorporate establishments.

For the purpose of making estimates for other years the 1939 totals of noncorporate operating revenues and payrolls were apportioned among seven industrial groups. The groups were selected partly to make it possible to use data from income tax returns and partly as combinations of groupings for which the Department of Commerce has prepared sales estimates. The analysis of operating revenues and payrolls for 1939 and the computations of the constant weight ratios for other years are summarized in Table C.

1/Line A includes food, grocery, and consumer farm products wholesalers; line B includes wholesalers of raw materials excluding grain.

2/Lines B and J were estimated on the assumption that the ratios of line B to line A and line J to line H are the same as in col. 1.

3/Includes paints, drugs and sundries, and tobacco and tobacco products (excluding leaf) wholesalers.

4/Line F includes hardware and electrical goods, line G includes plumbing and heating equipment wholesalers.

5/Statistics of Income total of \$1,646 million for lines F and G was prorated on col. 1.

6/Statistics of Income total of \$9,777 million minus lines B + J.

iii Payrolls and Operating Revenues
of Retail Firms

For retail trade there are available (a) annual estimates of sales by kinds of business comparable to the 1939 Census figures, (b) an annual estimate of total payrolls, and (c) annual data on corporate operating revenues by kind of business. Estimates of noncorporate operating revenues and payrolls by kinds of business were developed for 1939, and for each kind of business the 1939 ratios were applied to (a) to give estimates for other years.

Corporate payrolls (in millions of dollars) in 1939 were estimated as follows:

Table D

A	Retail stores	2,824
B	Central offices and warehouses	224
C	Auto repair services	37
D	Tips and furnished meals	<u>120</u>
E	Total (A thru D)	3,205

Sources: Line A, Sixteenth Census, Retail Trade: 1939, p. 71.
Line B, Idem, pp. 183-184.
Line C, Sixteenth Census, Service Establishments: 1939, pp. 99-100.
Line D, Estimated as two-thirds of Department of Commerce estimate for all retailers. From files of National Income Division.

Noncorporate payrolls were estimated at \$2,370 million by deducting this total from the Commerce Department's estimate for all retail trade, \$5,575 million. All omissions from the

Census were thus assumed to be noncorporate.

The method of apportioning this noncorporate payroll estimate by kinds of business is shown in Table E. Table E also gives the 1939 estimates of noncorporate operating revenues by kinds of business, and the ratios used for estimating noncorporate payrolls and operating revenues in other years. Noncorporate operating revenues may well be under-estimated, for the allowances for omissions are smaller than the allowance implicit in the Commerce Department estimates of total retail payrolls.

iv Payrolls and Operating Revenues of Six Service Groups

Annual estimates both of total payroll and of corporate operating revenues (adjusted Bureau of Internal Revenue figures) are available for six industrial categories of service enterprises. The ratios used in connection with these series were derived from estimates of corporate payrolls and estimates of noncorporate operating revenues in 1939. Census figures were used for the corporate payrolls of four of these industry groups. This procedure makes the implicit assumption that all Census omissions for these groups were noncorporate. In the case of the business services and trade schools group a rough blow-up was applied to allow for the omission of commercial and trade schools. Census data for motion picture production and for film exchanges do not include any detail by type of legal organization. For these industry groups the entire payroll of producers and of manufacturers' sales branches and half the payroll of service and limited function wholesalers was included in the estimate of corporate payrolls for the motion picture group. For owners of motion picture theaters, corporate payrolls were included.

The noncorporate payroll for each group was estimated by subtracting the corporate figure from the Commerce Department's estimate of total payroll. In conjunction with these estimates Census figures on noncorporate payrolls and on

receipts were then used to estimate noncorporate operating revenues. For this purpose the Census ratio of receipts to payroll was applied to the estimated noncorporate payroll.

These computations and the computations of the ratios employed in making estimates for years other than 1939 are set forth in Table F.

1/133.3% of Census figure (\$167 million) to allow for omission of commercial and trade schools. According to Survey of Current Business, April 1946, corporate sales for such schools and employment exchanges were \$255 million; for other business services, \$728 million in 1939.

2/Col. 1, line E includes (a) all motion picture production, Sixteenth Census, Statistical Abstract of the U. S., 1945, p. 853, (b) motion picture exchanges classed as manufacturers' sales branches, Sixteenth Census, Wholesale: 1939, p. 52, (c) 50% of other motion picture exchanges, Idem, p. 49, (d) motion picture theaters owned by corporations, Sixteenth Census, Service Establishments: 1939, p. 560. Cols. 6 and 7, line E include only noncorporate motion picture theaters, Ibid.

v. Payrolls of Construction Contractors

The Department of Commerce estimate of the total payroll of the construction industry (Survey of Current Business, June 1945, p. 19) is somewhat larger than the total reported in the 1939 Census (Sixteenth Census, Construction: 1939, p. 12).

A Census estimate	\$1,404 million
B Commerce estimate	\$1,546 million

The Census shows that 52.6 percent of reported payrolls were paid by corporations (Construction: 1939, p. 21), or \$739 million. It is here assumed that all omissions from the Census were noncorporate. Hence the payroll estimate for each year was apportioned 47.8 percent (or $\frac{739}{1,546}$) to transactor group III (\$739 million), and 52.2 percent to transactor group IV (\$807 million).

vi Property Taxes and Noncorporate Commercial Mortgages

Property taxes, including special assessments and taxes on personality, were estimated as follows for 1939, as indicated above:

Table G
(millions of dollars)

	<u>Transactor Group</u>	<u>1939</u>	<u>Source</u>
A	Households	978	HH 202 T
B	Farms	452	AG 202 A

1/Arbitrarily reduced to take account of properties outside corporate limits.

The method of estimating the value of real estate shown in Table H, col. 1, line B and the amount of mortgage debt of transactor group IV at the end of 1939 (discussed below) may be illustrated by the following steps for manufacturing enterprises.

Table J
(millions of dollars except for figures in parentheses)

<u>Item</u>	<u>1939</u>	<u>Source</u>
A Total compiled receipts, all corp.	58,306	Stat. of Income 1939, Tbl. 3
B Total compiled receipts, smallest corp.	1,978	Stat. of Income 1939, Tbl. 6
C Net capital assets, smallest corp.	296	Ibid.
D Bonds & mtgs. paybl., smallest corp.	91	Ibid.
E Ratio, compiled receipts, all corp. to smallest corp.	(29.48)	A ÷ B
F Payroll, Ind. Corp.	12,183	IC 211 K
G Payroll, Ind. Corp. & Bus. Pr. & Pt. et al	13,585	IC 211 J + K
H Ratio, payroll Bus. Pr. & Pt. et al & Ind. Corp. to Ind. Corp.	(1.115)	G ÷ F
J No. of employees & proprietors, Bus. Pr. & Pt. et al & employees, Ind. Corp. (M)	(10,091)	Survey of Cur- rent Business, Jy. 1947 Suppl., pp. 36, 39
K No. of employees, Bus. Pr. & Pt. et al & Ind. Corp. (M)	(9,967)	Idem, p. 36
L Ratio, employees & proprietors to employees	(1.012)	J ÷ K
M Indicator ratio, Bus. Pr. & Pt. et al to smallest corp.	(3.77)	E x [(L x H) minus 1]
N Est. real estate, Bus. Pr. & Pt. et al	1,117	M x C
O Est. mtg. debt, Bus. Pr. & Pt. et al	343	M x D

Similar computations were made for mining, transportation and communication, trade, construction, and service. These computations gave the following totals for group IV as of the end of 1939:

Real estate	\$8.5 billion
Bonds and mortgages	\$3.07 billion

The Department of Commerce estimate of commercial noncorporate mortgages as of that date is \$3,958 million. Thus the above estimate indicates that 77 percent of noncorporate commercial mortgages were obligations of transactor group IV. 80 percent were assigned to this group in each year and 20 percent to group X.

vii Federal Excise and Miscellaneous Taxes

In each of the seven years 97 percent of federal excise taxes and 81 percent of federal miscellaneous taxes were assigned to industrial corporations, and the rest of these taxes was assigned to business proprietors and partnerships et al. These percentages were based on detailed allocations for 1939 as in the accompanying tables. For most items Census data on value of products (or other comprehensive data) were available as a basis of allocation.

Table K

	Total	Corporate	corporate	Non-

viii Real Estate Transfers and Instalments to Contractors
a/c New Residential Construction

In the apportionment of instalments to contractors on account of new residential construction it was assumed that 30 percent of such instalments were for tenant occupied properties in the case of single-unit structures (including row houses), 65 percent in the case of two-family structures, and 100 percent for all others.

These ratios represent judgmental adjustments of ratios computed on the basis of the Sixteenth Census as follows. The total number of tenant occupied units and units for sale or rent was reported under these three heads; also the total for all tenures. Both owner occupied and tenant occupied units constructed within the ten years preceding the Census were assumed to be divided among these three types of structure in the same proportions as all dwelling units. This rough computation is shown in Table L, lines K through Q. It indicated the following percentages of tenant units to total units for properties constructed during the decade:

Single-family	33 percent
Two-family	64 percent
Other	85 percent

The adjusted percentages used on SR 211 (30 percent, 65 percent, and 100 percent respectively) represent a crude judgmental allowance for misstatement in the above computations.

Related data from the Sixteenth Census were used to give crude estimates of the value of existing residential properties passing from the hands of owner occupants into rental status or nonresidential use. One estimate was made by comparing the increment in the number of occupied units with the number of units reported as less than ten years old. This comparison indicated that 2,114,000 units passed out of owner occupied status during the decade (col. 1, line F). Average value per nonfarm unit for sale or rent, 1940, based on Census tabulations is \$3,321. Thus the annual average source of money to households from sale of residences during the decade may be estimated at \$701 million (col. 1, line J). Annual sales of farm land to private transactors for nonfarm use have been estimated at \$100 million (AG 101 B). Assuming that two-thirds of this amount represents a disposition of money by households, we have net receipts by households from real estate transfers estimated at \$634 million. The rounded figure \$600 million appears on HH 101 Q.

A rough estimate that 576,000 dwelling units passed out of residential use during the decade, was similarly computed (col. 3, line F). At \$3,321 per unit this would mean that transactors acquiring such properties (chiefly industrial corporations and business proprietors and partnerships et al) must have expended some \$190 million per year. Such expenditures were assumed to be \$100 million a year by industrial

A188

corporations and \$100 million a year by business proprietors and partnerships et al.

These rough estimates probably err on the side of overstatement both because vacancies are not taken into account (they were presumably higher in 1930 than in 1940) and because line E is probably an overstatement — people tend to underestimate the age of dwelling units.

ix Other Instalments to Contractors

Instalments accruing to contractors from the several transactor groups were estimated by applying rough ratios to the various annual component estimates of the value of construction work published by the Department of Commerce,^{1/} May 1944.

The bench mark information on construction is far from adequate for the purpose of determining appropriate ratios, and it was necessary to resort to various crude procedures.

Instalments to contractors include instalments to subcontractors. Only instalments to prime contractors can be directly related to the value of construction work. The relation of estimated total instalment receipts to estimated receipts by prime contractors in 1939 is as follows:

Table M
(millions of dollars)

<u>Item</u>	<u>1939</u>	<u>Source</u>
A Instalments to prime contractors	4,997	Tbl. P, col. 5, line U
B Instalments to subcontractors	524	(PP 202 I) + (IC 202 N)
C Total	5,521	A + B
D Instalments to Ind. Corp. contractors	2,208	IC 101 T
E Instalments to Bus. Pr. & Pt. et al contractors	3,313	PP 102 F
F Total	5,521	D + E

^{1/}Revisions of these estimates have since appeared, but it did not seem feasible to take account of these revisions in these computations.

The total value of construction work in 1939, according to the Department of Commerce estimates, was more than twice total instalments to prime contractors as estimated on line A above. The difference between these two estimates was assumed to be due to two factors: the value of force account construction work and the value of equipment installations by manufacturers and dealers. Some effort was made to include such equipment installations as contract construction in the 1939 Census, but the coverage must have been distinctly haphazard. The relation between the estimated total value of construction work and the estimated instalments to prime contractors may be detailed thus:

Table N

J Instalments to prime contractors	4,997	Tbl. P, col. 5, line U

1/Construction Activity in U. S., Special Release May 1944,
U. S. Department of Commerce.

Instalments to prime contractors as reported in the Sixteenth Census, Construction: 1939, Table I, totaled \$4,520 million, unincorporated establishments accounting for 53.6 percent of this total, or \$2,425 million. Assuming that omissions are all noncorporate, and are comparable to payroll omissions (see App. A 3 v) the Census total should be increased by $\frac{807-665}{665} \times 2,425$ or some \$500 million, to a total of \$5 billion.

Tables VI, XIII and XV of the Sixteenth Census, Construction: 1939, give information on value of construction work by type of project, although the two latter tables cover only the larger establishments (with business of over \$25,000). An attempt was made to piece the information from these three tables together, and to blow it up to approximately the \$5 billion. A comparison of the result with the Commerce Department estimates of total value of construction work by type was used as a guide in determining the allowances to make for force account work and dealer and manufacturers installations. Thus the type of project components of instalments to prime contractors were estimated. These components were then apportioned to the various transactor groups. In a number of cases the entire component was assigned to a single transactor group. But several of these components had to be apportioned by groups on the basis of rough judgmental percentages. The following table summarizes the

estimates of force account work and dealer and manufacturer installation allowances and of instalments to prime contractors. In general col. 4 is approximately equal to col. 1 divided by col. 2, but in some instances there is a judgmental deviation from this formula.

It would undoubtedly have been possible with the available information materially to improve the method of estimating instalments to contractors summarized in the table below. However, more refined methods would have involved a good deal of additional work, and it did not seem feasible to undertake a more careful set of estimates in connection with this exploratory study.

	Premiums Pd.	Benefits Recd.	Source
A Pd. or recd. by Households	4,127	2,750	HH 102 T HH 203 (D thru I) minus M
B Pd. or recd. by Farms	97	46	AG 101 D + N AG 202 J + N
C Pd. or recd. by other transactors	1,843	551	D minus (A + B)
D Pd. to or by All Ins. Carriers	6,067 1/	3,347	

1/Total premium receipts \$6,254 million minus dividends to policyholders of \$187 million.

Detail by types of policy was used in estimating lines A and B (see worksheets referred to above). Such detail from the reports of the New York State Insurance Commission was blown up to provide an analysis of the totals on line D, and (by subtraction) of line C. The detail for line C was then

apportioned among transactor groups III, IV, VII and X, as indicated in Table R. Lines D and N of Table R were apportioned on the basis of estimated property taxes paid. Line F was apportioned between two sectors and line G among all four sectors on the basis of payrolls. The other apportionments are arbitrary.

Total premiums and total benefits for the four sectors for other years were assumed to be distributed in the same proportions as in 1939, i.e., the percentages on lines J and R were applied to totals for other years corresponding to those on line D of Table Q.

Table R
Apportionment of Insurance Premiums and Benefits
Among Four Transactor Groups in 1939

Type of Policy	Ind. Ind. Corp. (1)	Bus. Pr. & Pt. et al (2)	Bks. & U.S. Mon. Funds (3)	Sec. & R. Firms et al (4)	Total (5)

Q Total	263	138	14	136	551
R Percent	47.5	25.0	2.5	25.0	100.0

xi Household Portfolios

Although household portfolios are an extremely important item, the informational basis for estimating them is particularly unsatisfactory. The methods employed for four of the major components of this item were sufficiently considered in Section 2: government obligations, mortgages on farms, mortgages on one to four family residential properties, and repurchasable shares of savings and loan associations. The remaining component is a very large one. It includes all other forms of indebtedness held by households plus corporate stocks.

As already explained, the annual increments used in connection with this large component were based on the Securities and Exchange Commission's estimates of savings in the form of individual holdings of "securities, corporate and other". This series represents the increment in the holdings by households of corporate stocks and corporate obligations. Where title to such instruments is held by a natural person directly, or through his participation in a business partnership, it is assumed that the title is held by the natural person in his capacity as a member of a household. However, this Securities and Exchange Commission estimate is on a net basis in that the increment refers to holdings less bank loans for purchasing or carrying securities. Hence the

adjustment of HH 311 O to a gross basis on HH 311 Q. Line Q is not precisely adapted to our present purpose but the estimate on HH 311 S is so rough that further attempts at adjusting HH 311 O did not seem warranted. 1/

It remains to consider the crude estimate of total holdings of stocks and miscellaneous forms of indebtedness for December 31, 1939 used in passing from HH 311 Q to HH 311 R.

The miscellaneous indebtedness holdings of households on that date were assumed to be obligations of transactor groups III, IV, X and XI. It was further assumed that short-term obligations of these groups were held chiefly by banks and security and realty firms et al. Estimates of short-term obligations and of the noncorporate residential mortgage indebtedness of group X (a portion of such mortgages being previously included in household portfolios) were therefore deducted from debts n.e.c. of these groups to obtain a total to be apportioned among holder groups. This process may be outlined as follows:

1/The manuscript of Irwin Friend's monograph on the Volume and Composition of Individual Savings became available too late for this study to profit by it. This study makes it possible to improve and simplify the estimates of household holdings of stocks and nongovernment obligations. Among the further adjustments that might be made in HH 311 R are (a) subtracting the increment in the excess of the holdings of securities by noncorporate security dealers over bank loans to all security dealers, (b) adding the estimated increment in household holdings of noncorporate commercial mortgages, (c) subtracting the estimated increment in institutional holdings of private securities.

Table S
Miscellaneous Debts Outstanding December 31, 1939
(millions of dollars)

		Gross (1)	Deduc- tions (2)	Net (3)
A	III Ind. Corp.	40,000	1/ 5,000	35,000
B	IV Bus. Pr. & Pt. et al	7,700	1/ 4,500	3,200
C	X Sec. & R. Firms et al	31,800	1/ 14,300	17,500
D	XI R of W	4,105	2/ 0	4,105
E	Total of above	<u>83,605</u>	<u>23,800</u>	<u>59,805</u>

1/See P&B III, IV, and X.

2/Short-term debt estimated at \$4.1 billion and noncorporate residential mortgages at \$10.2 billion.

3/Private U.S. long-term investments abroad (excluding direct investments), International Transactions of the U. S. 1940-1945, U. S. Department of Commerce, 1948, p. 110.

Next the holdings of the indebtedness included in the \$59.8 billion total were estimated for six transactor groups as follows:

Table T
Holdings of Miscellaneous Indebtedness December 31, 1939
(millions of dollars)

A	V Fed. Govt.	3,500	Based on a special Fed. Res. tabulation
B	VII Bks. & U.S. Mon. Funds	6,800	See footnote 1/
C	VIII All Ins. Carriers & IX	13,200	See footnote 2/
D	XI R of W	5,340	<u>Intl. Trans. of the</u> <u>U. S., p. 110</u> 3/
E	(In IV) Endowments	600	Est. as PP 301 (N+P) x (65.0%)
F	Total	<u>29,440</u>	

1/Corporate and foreign bonds plus nonfarm, nonresidential mortgages (Comptroller of the Currency, Annual Report 1940, p. 276) plus estimated term loans (see Term Lending to Business, National Bureau of Economic Research, pp. 139 and 274).
2/Estimated bonds held (based on Spectator and New York Insurance Reports) minus government bonds held (Treasury, Annual Report 1943, p. 751) plus estimated nonfarm, nonresidential mortgages held (based on a special report of the Federal Savings and Loan Insurance Corporation, August 8, 1947).

3/Private foreign investments in the U. S. (excluding corporate stocks and state and municipal obligations).

Presumably substantially all of the remaining miscellaneous obligations (\$59,805 million minus \$29,440 million) were held by transactor groups I, III and X. A rough analysis of interest receipts indicated that households received about three times as much interest on such obligations as industrial corporations and security and realty firms et al taken together. Household holdings were therefore estimated as (75%) $\times \$30.4$ billion or \$22.8 billion.

Data for estimating holdings of stocks are much less satisfactory. Total paid-in capital shown on P&B III, VII and X for December 31, 1939 is \$111,540 million. A TNEC monograph indicates that about 5/8 of stock at the end of 1937 was held by households.^{2/} The household estimate is thus 5/8 $\times \$111.5$ billion or \$69.7 billion, and the estimated total of stocks plus miscellaneous debt as of December 31, 1939 is \$92.5 billion.

^{2/}The Distribution of Ownership in the 200 Largest Nonfinancial Corporations, Temporary National Economic Committee, Monograph 29, p. 9.

xii Gross Transfer Receipts and Expenditures

The explanation of GNP expenditures and net transfer expenditures given on pages A145 to A160 of this appendix can be used to show how gross transfer expenditures, gross transfer receipts, and nonfinal product receipts should be calculated. Some of those who wish to use the estimates presented in this study may prefer to have Table 33 (Synopsis of GNP Expenditures, Loanfund Financing and Other Moneyflows) on a gross basis. Accordingly we give below a table of transfer flows in which receipts have not been netted against expenditures. The various categories of moneyflows transactions included here as transfers are listed in Exhibit B of Chapter IX of the main text. This table of transfer flows, and the statements of payments and balances, can be used to gross up Table 33.
