What is done in England by combination, unless it be the management of municipal concerns, is most generally done by a combination of individuals, established by mere articles of agreement. On the other hand, what is done here by the co-operation of several persons, is, in the greater number of instances, the result of a consolidation effected by an express act or charter of incorporation. ... We cannot but be impressed with a deep sense of the importance of this law in our own country ... In no country have corporations been multiplied to so great an extent, as in our own. If a native of Europe, who has never traversed the wide barrier which separates him from us should be informed, even with tolerable accuracy, of the number of Banking Companies, Insurance Companies, Canal Companies, Turnpike Companies, Manufacturing Companies &c. ... that are diffused throughout these United States, and fully invested with corporate privileges, he could not be made to believe that he was told the truth. -- Joseph Angell and Samuel Ames, A Treatise on the Law of Private Corporations Aggregate (Boston: Hilliard, Gray, Little & Wilkins, 1832), v-vi, 35.

By breaking away from Great Britain and forming a new system of government, the Founding generation transformed the institutional basis of their young nation’s economy. No longer rigidly tied to Britain’s empire or laws, Americans were free to build upon their colonial and British heritages and to adapt the best features of the Old World to the unique circumstances of the new. They strove to imitate what worked well, improve what did not, develop what remained inchoate, and jettison what failed miserably. The multi-faceted economic transformation they engineered spawned the world’s largest, richest, and most dynamic economy. ¹
The development of the for-profit business corporation was one of the most original and important aspects of the new nation’s institutional transformation. Before the Revolution, American business corporations were few, small, and largely inconsequential. The weight of imperial regulations and unenlightened and uninspired British corporate law, which imposed relatively high costs on would be incorporators while offering little in the way of benefits, induced most colonial entrepreneurs to choose other business forms, including sole proprietorships, partnerships, or, occasionally, the unincorporated joint stock firm. Table 1 shows that after the Revolution, and particularly after ratification of the Constitution, U.S. corporations rapidly grew in number. By 1801, the institutional groundwork for further growth and development – some 20,000 specially chartered corporations with about $25 billion of authorized capital would be created by 1860 – had been laid. As the head quote suggests, within a generation America became the world’s leader in corporate development, including the number of corporations and the sophistication and flexibility of its innovative corporate law.

The 3,884 entrepreneurs involved in forming early U.S. corporations opted for the corporate form when the net benefits (all benefits minus all costs) of incorporating exceeded the net benefits of forming a sole proprietorship, partnership, or other type of business organization. For some lines of business, like commercial banking and insurance, the net benefits of incorporation almost always outweighed the net benefits of other business forms. For other lines, particularly manufacturing, non-corporate forms sometimes offered higher net benefits. A few early Pennsylvania iron manufacturers incorporated their firms, for example, but until the mid-nineteenth century most did not; tanners generally eschewed the corporate form throughout
the nineteenth century. In the 1790s, taxation was low and hence not a major consideration for entrepreneurs deciding whether or not to incorporate.

The two main costs of incorporation included internal agency conflicts between majority and minority shareholders, shareholders and bondholders, and shareholders and managers as well as the costs of obtaining a charter from state legislatures. The latter cost was increased by political animosities stemming from commercial rivalry as well as anti-corporate prejudices inherited from the Old World and the deepest recesses of the human psyche. Until well into the nineteenth century, incorporation required the formal sanction of government, at times subjecting early incorporators to intense political pressures. Those costs declined over the first half of the nineteenth century as anti-corporate sentiment waned (without disappearing) and state legislatures rendered the chartering process faster and cheaper.

The biggest benefit of incorporation was the almost singular ability of corporations to raise large, long-term pools of capital. Demand for long-term corporate securities, both bonds and equities, stemmed from six major sources: 1) the corporation’s power of perpetual succession; 2) its ability to sue and be sued in its own name; 3) limited liability and entity shielding; 4) various technical advantages of corporate over more complex and convoluted partnership law; 5) the sale of call options in the primary (issuance) market; 6) the existence of liquid secondary markets. In other legal aspects of business, from general contracts to the employment of agents, corporations could generally do, within the confines of their charter, whatever sole proprietors or partnerships could do. So when large sums of capital were necessary, and the costs of obtaining a charter were minimal, entrepreneurs usually opted for incorporation.
Quantifying with precision how much development of the corporate form aided the growth of the early U.S. economy presents insurmountable empirical barriers. That the corporate form helped the economy, rather than hurting it or serving a neutral role, is, however, undeniably. As explained above, entrepreneurs usually sought incorporation because they wanted to establish and operate large businesses more cheaply than they could by forming proprietorships or partnerships. Large business enterprises helped economic growth in at least three ways. First, in many lines of business they lowered production costs by exploiting economies of scale. Second, large size allowed for greater vertical integration where appropriate. Third, by holding out the promise of market power they stimulated entrepreneurship and hence helped to drive technological innovation. To the extent that it was too costly or even impossible to operate large businesses without a corporate charter, incorporation aided the economy.15

Counting Costs

Obtaining a corporate charter in early America was far from costless. Those costs varied over time, place, and type of business but clearly declined over time and just as clearly were from the start lower than in Europe. Moreover, the costs of obtaining incorporation compared to the costs of forming other types of businesses are easily overestimated. The costs of governing corporations, or in other words of limiting the internal agency problems that they faced, were considerable. Again, though, those costs tended to decrease over time and, compared to the agency costs of partnerships, are easy to overestimate.

Obtaining a Charter

In the United States in the 1780s and 1790s, as elsewhere in the world in the eighteenth century, so-called special incorporation was the norm. Obtaining a corporate charter required
passage of a statute, or in other words a law that explicitly granted corporate privileges to a specific group and that detailed the corporation’s name, location, and vocation, and that sometimes stipulated its authorized capital, the number and duties of its directors, stockholder voting rights and liability, and other corporate characteristics.16

Many, perhaps most, entrepreneurs were able to win a charter quickly and cheaply by petitioning the legislature of the state in which they wished to conduct business.17 Paper, pen, publicity, and postage, as well as the time needed to collect signatures and shepherd a bill through the legislature, constituted the biggest outlays. Other enterprisers expended large amounts of time, effort, and money, including the cost of lobbyists and bribes, before gaining charter.18 Costs increased, but usually were not doubled, when a corporation, like a toll bridge over the Delaware River (separating New Jersey from Pennsylvania), needed to obtain a charter from two states.19 Additional costs were incurred if a corporation needed to update its charter, a frequent occurrence.20 (In many states the number of charter revisions equaled or exceeded the number of new charters granted.)

Every experience was unique but some generalizations can be made. Generally, entrepreneurs who sought to compete with the state, either directly or because the state owned shares in existing enterprises, found it costlier to obtain a charter than ones who did not threaten the state’s coffers. Likewise, enterprises that seemed to offer more direct net public benefits found incorporation relatively cheaper.21 Toll bridge companies, for example, found it cheaper to gain legislative sanction than, say, mining companies. Turnpikes created public benefits but sometimes encountered political resistance because they could invoke the dreaded power of eminent domain.22 Smaller enterprises, all else constant, had an easier go of it than larger ones. Most importantly, the costs of obtaining a charter trended downward over time in most states as
anti-corporate angst subsided and more legislators sought to aid business interests. Legislators also became more efficient by copying existing charters, creating charter blanks and blanket corporation laws, and, eventually, passing general incorporation acts that de-politicized the chartering process. Those gains were partially offset, however, by increased imposition of bonuses or other taxes on new and existing corporations. Large increases in the number of corporate charters granted in the first half of the nineteenth century were a function of both an increased number of entrepreneurs seeking incorporation and the decreased cost of producing charters. (In economic parlance, more charters were obtained due to a rightward shift of the incorporation demand curve and a rightward shift of the incorporation supply curve.)

Regardless of time or place, legislators faced limits on the costs that they could impose on entrepreneurs, who enjoyed at least three other major options. One was to bide time and try again at the next session. The Bank of New York took that approach. Another was to set up operations in a more pliable state. The Society for the Establishment of Useful Manufactures, for example, opted for New Jersey after its legislature expressed support for the project. Likewise, the Jersey Bank nominally operated in Jersey City but kept an office on Wall Street where it conducted most of its business. Later, it incorporated in New York to avoid a New Jersey tax on bank capital.

A third option was to organize as an unincorporated joint-stock association, a sort of charter by private contract rather than government sanction. Precedent for this included British common law joint-stock associations in general and various colonial joint-stock associations, including the Philadelphia Linen Manufactory, in particular. Established during the long debt deflation that followed the French and Indian War, the organizers of the linen manufactory formed a joint-stock company by soliciting subscribers to articles of association or agreement.
that tried to replicate the main features of the corporation via contract. Initial and subsequent
stockholders signed “articles of agreement” providing for election of directors and other internal
governance procedures. Creditors, too, had to sign a contract stipulating that the association’s
stockholders were not personally liable for its debts.

Contracting costs and the legal risks of unincorporated status were high enough to induce
most associations to seek a charter until one was obtained. Nevertheless, a significant number
of entrepreneurs resorted to this expedient. The Bank of New York operated for some seven
years as a joint stock association. Massachusetts’s Essex Bank was also in operation for about
seven years before obtaining a charter. The option was removed for banking associations,
however, when states passed laws forbidding unincorporated entities from engaging in
commercial banking, or at least the note issue aspect of it. That did not stop other types of
companies from starting operations as associations, however. The New York Insurance
Company began operations in 1796 under article of associations before gaining a formal charter
in 1798. The following year, the Marine Insurance Office of Baltimore formed under articles of
association, its 400 shares snapped up by 36 area merchants. The Mutual Assurance Company
of New York began operations under articles of association in 1787; not until 1798 did it obtain
the official sanction of the New York legislature. The Stamford Mutual Insurance Company
likewise began its existence unincorporated, its members bound by a “constitution” dated
February 20, 1797. The Hamilton Manufacturing Society began operations a year before
receiving its charter in 1797 and the Salem Iron Factory Company began operations in 1796, four
years before obtaining its charter. Numerous other companies held direct public offerings of
stock (DPOs) in anticipation of obtaining a charter, a practice generally upheld by the courts.
The Warren Insurance Company and the Washington Insurance Company (both of Rhode
Island), for example, held DPOs, elected directors, and enacted by-laws before the Rhode Island legislature enacted their charters.  

The existence of such associations pressured governments to liberalize chartering provisions lest they lose control of the process and the power and taxes it brought. Considerable anti-corporate sentiment among voters, however, constrained legislators from too liberally doling out charters. Anti-market and anti-monopoly biases may be inbred, a constant condition of the human psyche but historical circumstances sometimes exacerbated those natural predilections. The Mother Country’s experience with monopolies, behemoths aligned with the government ostensibly designed to promote state ends while simultaneously enriching stockholders, directors, and managers, usually at the expense of consumers, further biased Americans against early corporations.

**Anti-corporate Angst**

In 1796, a British wit defined a corporation as “an infamous relic of the ancient feudal system; a tyrannical, exclusive monopoly, generally consisting of gluttons, idiots, and oppressors; brutes in a human form.” Harsh words indeed but by no means out of line with the sentiments of learned British scholars. “One great cheque to industry in England,” brilliant political economist David Hume was said to have asserted, “was the erecting of corporations, an abuse which is not yet entirely corrected.” University of Glasgow professor Adam Smith also disdained most corporations, which he believed caused two major problems, internal agency conflicts and monopoly. Agency costs arose from the fact that managers followed their own interests, which were often distinct from those of stockholders. “Being the managers rather of other people’s money than of their own,” Smith argued, managers did not watch over the business “with the same anxious vigilance with which the partners in a private copartnery
frequently watch over their own."47 Outside of banking, insurance, and large public works like canals and water utilities, joint-stock companies were ill-advised, Smith believed. For most corporations to be profitable, he argued, the government had to provide them with monopoly privileges, another “great enemy to good management” and economic efficiency.49

Monopoly for Smith came in two varieties, international trade restrictions and companies with considerable domestic market power.50 Both varieties were lucrative, Smith pointed out, so “merchants and manufacturers are always demanding a monopoly against their countrymen.”51 Business interests often won their monopolies by making government “subservient” to their interests. “They will,” he claimed, “employ the whole authority of government, and pervert the administration of justice, in order to harrass [sic] and ruin those who interfere with them in any branch of industry … they may chuse to carry on.”52 That made it costly, or in extreme cases impossible, for competitors to emerge.53 Able to quash competition with political force instead of innovation, monopolies grew fat, indolent, and inefficient.

Smith also argued that monopoly trade restrictions “must, in almost all cases, be either a useless or a hurtful regulation.”54 “All the original sources of revenue, the wages of labor, the rent of land, and the profits of stock,” he argued, “the monopoly renders much less abundant than they otherwise would be.”55 That was damning testimony indeed but not everyone agreed with Smith, especially monopolists and their apologists. Thomas Pownall, for example, told Smith that although he had “seen some errors in the extension of the measure, further than is expedient or necessary, yet I do not see the malignancy of the principle of monopoly; nor while I have lived amidst the daily proofs of the relative advantage which it gives to the mother country, by its colonies” over other foreign powers.56 In America, however, the nuance of the parent was lost; monopoly was evil, plain and simple.
The wrenching separation from the mother country helps to explain the especially deep antipathy toward monopoly voiced during the Early Republic. Complaints of Britain’s trade restrictions, its so-called monopoly of trade, suffused the imperial crisis, particularly the tea troubles. After the Revolution, hatred of Britain continued unabated, with frequent allusion to her “love of monopoly.” Anything smacking of monopoly was tainted and, in some states, unconstitutional. Tennessee’s constitution stipulated “that perpetuities and monopolies are contrary to the genius of a free state, and shall not be allowed” and other state constitutions did likewise. In 1787, for example, a New Yorker noted that there were two ways “by which a monopoly may be effected; one proceeding from the authority of the state, and the other by means of an association, which as it acquires artificial strength from the collective wealth, is enabled to surpass, and eventually to defeat, the efforts of enterprising individuals.” Because the state “happily denies the power to sanction a monopoly,” the commentator noted, “the only question that can arise is, how far the government ought to exercise its power to prevent one.” Other New Yorkers sought to amend the U.S. Constitution to prohibit the federal government from granting monopolies.

Monopoly also had dire political implications for early Americans. Perhaps Thomas Paine summed it up best when he wrote: “As property honestly obtained is best secured by equality of rights, so ill-gotten property depends for protection on a monopoly of rights. He who has robbed another of his property, will next endeavour to disarm him of his rights, to secure that property.” For many early Americans, corporations smacked too much of aristocracy, of hereditary privilege. They saw corporations as permanent monoliths because they did not yet appreciate the rapid change in ownership that the joint-stock form and liquid secondary markets
made possible. Nor did they yet understand that middling and poorer sorts could, and would, own corporate equities.67

Distrust of monopoly ran so deep in the 1790s that some Americans opposed patents because “they conceive them to be monopolies.”68 Learned Vermont jurist Nathaniel Chipman called “a system of monopoly, one of the greatest evils in civil policy.”69 While he tolerated them “in a limited degree, for the improvement of arts, and the encouragement of genius,” New York jurist James Kent also castigated monopolies because they fostered “inequalities of power and property,” inviting indolence, damping enterprise, and facilitating corruption.70 Like Smith, Kent also considered mercantilism a form of monopoly because it gave artificial market power to the center at the expense of the periphery.71

In addition to using “monopoly” to describe restrictive international trading systems like mercantilism, early Americans used the term to describe domestic market structures. Economists now think of competition as a spectrum, with perfect Smithian competition at one end and monopoly at the other. In between lay monopolistic competition, oligopoly, duopoly, contestable monopolies, and other types of imperfect markets.72 Early Americans, by contrast, labeled any market power, anything that was not pure competition, monopoly. They simply did not have the terminology to express the notion of market power in any other way. Use of the word monopoly in English dates to at least the sixteenth century. By the mid-eighteenth century, if not earlier, its meaning in some contexts strayed from the strict definition of the exclusive possession or control of a good to any persons or groups that could influence price, quantity, or quality.73 Duopoly, oligopoly, monopolistic competition, and market power, by contrast, were not widely used until the twentieth century.74 The broad definition of monopoly explains why early Americans
regularly used it to describe market structures that clearly were not characterized by a single dominant firm.\textsuperscript{75}

When early Americans used the word monopoly they sometimes meant precisely the same thing we mean by it today, an industry dominated by a single large producer. Clearly, however, they sometimes simply meant market power, as evidenced by more discerning writers who qualified their use of the term with phrases like “exclusive,” “complete,” “partial,” “almost,” “principles of,” “spirit of,” “sort of,” “partaking of the nature of,” and so forth.\textsuperscript{76} Baker John White, for example, explained to the Massachusetts legislature that for centuries the number of bakers allowed to bake in Great Britain had been limited by the bakers themselves.\textsuperscript{77} That policy, he argued, was “attended with the same consequences, as a monopoly, though in a less degree.”\textsuperscript{78} An anonymous writer in 1791 noted that traders could collude to bring “trade near to an open, or at least a concealed, monopoly.” “They will have momentary power,” he argued, but soon they will suffer “a weakness as great as their short-lived splendour was dazzling.”\textsuperscript{79} Economists today recognize this as a failed attempt to create a cartel. Similarly, Philadelphians long complained about a law that mandated that all auctions within the city be conducted by a single vendue master.\textsuperscript{80} In 1790, the legislature responded by appointing a second vendue master. “A Philadelphia Merchant” objected, noting that “this, to be sure, may be a temporary \textit{palliative}; but can never effect a \textit{radical cure} of the evils attendant on a monopoly of this business. For if a \textit{monopoly} be dangerous and liable to abuse, the same objection may be made against confining it to \textit{two}.”\textsuperscript{81}

In early tariff debates, legislators also used monopoly loosely, as economists use the term market power today. In 1789, for example, George Gale (1756-1815, F-MD) thought a 9 cent levy on beer too dear because it “would give the brewers here a monopoly.” Thomas Fitzsimons
(1741-1811, F-PA) and Tench Coxe both spoke of breaking the “monopoly” European nations enjoyed in the Eastern trade. Similarly, in 1797 “An Inhabitant” of New York complained that numerous “small grocers and hucksters” monopolized the market for food. “Not a vessel or boat” laden with food, he complained, was “not bought up in large quantities for the purpose of retail” whereby consumers were forced to pay “of those retailers at the advance from 25 to 100 per cent.”

More to the point here, critics assailed early U.S. corporations as evil monopolies even when the institutions sought or obtained nothing close to full market power. Critics often portrayed banks as monopolies, for example, even as they proliferated and even though they did not claim the exclusive right to make loans, accept deposits, or even issue notes. Although it helped America to win its independence by serving as a quasi-central bank during the final phase of the Revolution, the Philadelphia-based Bank of North America came under intense political fire that in 1785 led to the revocation of its Pennsylvania charter. Bank critic William Findley admitted that “whether the bank is a monopoly in the strict legal sense of the word” was an open question. But “in the common sense,” he claimed, it was “a monopoly, and being so in its nature, it must be so in its effects.” That made it “inconsistent with not only the frame, but the spirit of our government.” “By taking advantage of a scarcity of money, which they have it so much in their power to occasion,” he claimed, the bank’s directors and stockholders “may become sole lords of the soil.” Apparently, like some other early bank critics, Findley believed the bank could control the money supply and interest rates and hence, to a considerable degree, land prices.

The Bank of North America’s founder, merchant-speculator-politician Robert Morris, retorted that there was no chance that the bank’s stockholders could form a “monopoly” because
they were numerous and diverse and the market for the bank’s stock was active. In fact, he argued, the bank prevented monopoly in other areas of the economy by extending credit to numerous entrepreneurs. Finally, market forces, not the bank, determined the money supply.87 The Bank of North America won re-charter in 1787 but over time became just one state-chartered commercial bank among many.88 The problem had never been the bank itself but rather the lack of competition. One critic of the bank argued that “it will not be denied to be a monopoly, if it has sufficient influence to make head against all attempts at establishing a similar institution,”89 an allusion to a failed attempt to establish another bank in Philadelphia in late 1783 and early 1784.90 Rather than destroy the bank, and perhaps the nation’s struggling economy with it, the solution was to grant additional bank charters. “The establishment of another bank,” many realized, would produce “a speedy and power influence towards producing” desirable ends, like a flourishing economy. Competition would squelch the “untowardness of men’s passions” more readily and thoroughly than direct government regulation could.91

The Bank of North America’s successor as the national government’s bank, the Bank of the United States (BUS), also found itself assailed as a monopoly even though it clearly was no such thing in the strict sense of the term. Even some shareholders of the Bank of North America called the new bank a monopoly!92 John Taylor claimed that the BUS allowed a small number of people to monopolize “the bulk of the circulating medium.” Apparently, he feared the bank would be able to influence both interest rates and the price level by increasing or decreasing the quantity of money in circulation.93 Although the BUS dwarfed existing banks early on, it steadily lost market share because its capital remained fixed while state banks multiplied rapidly. Moreover, its monetary liabilities (notes and deposits) were convertible on demand into gold or silver, firmly tethering the money supply and interest rates to world markets.
Nevertheless, claims of the Bank’s monopoly persisted. “Was it necessary that the advantages arising from the deposits of public money,” William Findley asked, “should be given as a monopoly to one institution, and government deprived of a competition of proposals?” George Jackson (1757-1831, R-VA) also considered the BUS “a monopoly of the public monies.” In fact, it was not even that because the Treasury Secretary could and did deposit monies elsewhere for various reasons. But most public funds went into it and under the broader definition of monopoly then current, that was enough. For the same reason, Peletiah Webster could credibly complain of the “monopoly of bank-influence in the hands of a few stockholders” of the BUS.

Disappointed loan applicants who blamed Federalist-controlled banks for extending discounts based on political preference further fueled claims of monopoly. In sooth, those denied loans should have blamed excess demand for loans at the maximum rates allowed by law for their misfortune. After the incorporation of more banks, including some which lent extensively to Republicans, monopoly charges faded. “A necessary competition,” one observer claimed after the Manhattan Company began banking operations, “has annihilated the despotism of banking monopoly.” Some non-bank corporations, particularly manufacturing companies, may have also enjoyed considerable local market power simply due to the high transportation costs that prevailed in parts of the early nation, particularly the South. In those situations, allowing additional corporations to form in the affected region provided the necessary relief.

Paradoxically, then, Americans’ morbid fear of monopoly engendered corporation proliferation, and not only in banking. In his 1791 report on manufacturers, Treasury Secretary Alexander Hamilton claimed that opponents of “the expediency of encouraging manufactures in the United States” argued that “a virtual monopoly will be given” to those aided
“and an enhancement of price, the inevitable consequence of every monopoly” would soon follow. Hamilton responded, correctly, that “the internal competition, which takes place, soon does away every thing like monopoly, and by degrees reduces the price of the article to the minimum of a reasonable profit on the capital employed.” That did not stop George Logan, dressed in the rhetorical garb of “A Farmer,” from arguing in 1792 that the Society of the Establishment of Useful Manufacturers would injure manufacturing because no man would “think of giving seven years of the prime of his life to acquire the knowledge of any profession in which he may be supplanted by a juncto of monied men, under the immediate patronage and protection of Government.” Logan exaggerated, and missed Hamilton’s point. For the most part, early charters merely enabled corporate entrepreneurs to compete against other economic entities. Market forces dictated which businesses won and which lost. Sometimes, as in marine insurance, corporations came out on top. Other times, as in manufacturing, a variety of business forms persisted for generations.

Early corporations may have enjoyed the presumption of monopoly, as Supreme Court justice Joseph Story later held, but in fact few charters contained explicit promises of monopoly rights. In 1799, New Jersey granted a corporation the exclusive right to sell maps of the state for 15 years. It clearly thought of the monopoly as akin to a patent or copyright as the mapmaker’s intellectual property, the extensive surveys required to create the first copy of the map, could easily be lost to a mere copyist. For similar reasons, bridges and other transportation companies were often promised a local monopoly of so many yards or miles for a period of years in order to protect their capital investment.

In most instances, however, government protection of monopoly rights was neither necessary nor desired. Where monopoly was granted, or where a degree of natural monopoly
was thought to exist, state governments regularly capped tolls, interest rates, or dividends. 106 Nevertheless, criticism of corporations continued, their “monopoly” powers associated with special privileges. Corporations “are founded on the right claimed by government, to confer privileges and immunities on one class of citizens, not only not enjoyed by the rest, but at the expense of the rest,” Jeffersonian political economist Thomas Cooper complained. 107 Anger towards non-business corporations, like corporate municipalities, that restricted economic freedoms also ran high. 108 Non-corporations that sought to increase, or at least maintain, their market power, also met disfavor. When the first chartered marine insurers appeared, premiums dropped, inducing individual underwriters to protest vigorously. By reducing premiums, one apologist argued, showing little regard for his clients, the new corporations did nothing but invade “the fair profits of private industry.” 109 Legislators generally refused to arrest progress by giving in to the cries of those being fairly defeated in the marketplace.

In the nineteenth century, disdain for special privileges and favors dramatically reduced the cost of obtaining a charter by ushering in the age of general incorporation. 110 That anti-corporate angst eventually led to the creation of more corporations should not be surprising because most Americans hated only other people’s monopolies. Their own monopolies and corporations were just fine, as evidenced by the fact that many of the people who wailed against some corporations were stockholders or directors in others. 111 “There is scarcely an individual of respectable character in our community,” two jurists noted in the early 1830s, “who is not a member of, at least, one private company or society which is incorporated.” 112

**Governing the Gargantuan**

From political economist Adam Smith to mining observer George Taylor, critics noted that internal agencies problems within corporations were endemic. 113 George Logan argued in
1792 that corporate managers were “uninterested Agents” that aggrandized themselves at the expense of shareholders. Corporations certainly faced internal agency problems, but so too did partnerships, especially ones that tried to achieve large scale. Partners were fully liable for each other’s debts so they had to monitor the activities of other partners closely. Adding partners added capital but also monitoring costs. Partnerships coped with that tradeoff the best they could, usually by limiting their size and number of partners, but at times they succumbed to internal squabbling, shirking, and even theft. Forewarned of agency internal conflicts, entrepreneurs and legislators were forearmed. As a result, the governance of early U.S. corporations was remarkably good.

Legislators put some features of early corporate governance into place mainly to protect the public from potentially rapacious companies. Limitation of corporate charters to a specific number of years and explicit provision of their right to repeal or amend charters led the list, but to some extent maximum capitalization, voting rules, and mandatory director rotation also were thought to protect society from the influence of a few great rich aristocrats. Such strictures, however, were also important mechanisms of internal corporate governance.

Some early corporate charters provided shareholders with one vote for each share they owned, respectively, as is typical today. Other charters, however, stipulated that each shareholder received one vote, regardless of the number of shares he or she owned. Others mandated what Alexander Hamilton called a “prudent mean,” a voting rule between the extremes of one person, one vote and one share, one vote. The idea was to balance the power of large and small shareholders, so that each felt protected from the others. Voting was by secret ballot, so that stockholders could exercise their franchise and “avoid the odium and violence of party prejudice.”
According to historian Colleen Dunlavy, under the common law shareholders received one vote per person unless the corporate charter stipulated otherwise. Since most early charters did not discuss voting rules, most corporations provided each shareholder with one vote, she concludes. As an empirical matter, however, three quarters (238 of 319) of early charters did, in fact, explicitly mandate voting rules. (The other 80 were either completely silent on matter or were so poorly worded that no determination could be made with confidence.) About one-third (98) of early charters explicitly granted shareholders one vote per share without limitation. Approximately 1 in 5 (64) stipulated that shareholders should receive one vote per share up to some limit, like 5, 10, or 50 votes. About the same number (67) provided for some prudent mean voting rule. Less than 3 percent (9) explicitly stipulated one vote per person. Most of those were mutuals that had no shares upon which to base voting rights. Of the early nation’s 319 corporations, 13 were mutuals, 6 of which stipulated 1 vote per member and 2 of which provided for 1 vote per policy. The other 5 were silent. It makes sense that voting in those mutuals would have been based on the 1 vote per member or per policy models. But would such a voting scheme have been the default for joint-stock corporations?

Evidence of Dunlavy’s legal claim is inconclusive. The author of an important 1829 article noted that “it has long been perceived that the common law of corporations was not adequate to govern these numerous institutions.” The authors of the earliest treatise of U.S. business corporation law also did not discuss the issue directly. They did note, however, that “important changes, both silent and declaratory, have been made in this country as regards the law of private corporations.” In other words, British common law precedents did not always hold in America de facto, a point to which we shall return below regarding limited liability. It appears likely that when charters were silent on the issue of stockholder voting rights the
corporate by-laws would control. Some charters, especially earlier ones, made this quite explicit. Delaware, for example, empowered the directors of the Bank of Delaware to exercise “such powers, for the well-governing and ordering the said corporation, and the affairs and business thereof … as have been, or shall be fixed, described and determined by the rules, laws, regulations, and ordinances of the said corporation.” Similarly, voting rules were explicitly established in the corporate by-laws of the Sixth Massachusetts Turnpike Corporation, chartered in June 1799. More generally, early jurists made it clear that “where the mode of electing corporate officers is not prescribed by charter, or immemorial usage, it may be wholly ordained by by-laws.” Almost without exception, by-laws that were not contrary to the charter or the constitution or laws of the state of incorporation were valid.

In a corporation controlled by one or more large interests, minority shareholders could invoke other means of protection, including calling for third party inquiries into the corporation’s activities and depressing stock prices by voting with their feet, selling off their shares in one of the nation’s numerous equities markets. Regardless of voting rules, courts generally worked to assure that stockholder meetings and corporate elections were transparent and fair. They insisted, for instance, that meetings be adequately advertised, that quorums be achieved before binding decisions could be made, and that treasury stock (shares owned by the corporation itself) could not be voted.

Moreover, minority stockholders did not need as much protection then as they do now because charters constrained the activities of early corporations, or to be more precise, their managers, a point upheld by early case law. “If a company be formed … to supply water,” jurist James Kent explained, “the nature of their business does not raise a necessary implication that they should have power to make notes, and issue bills; and there must be express authority to
enable them to do it.”129 So when the Potomack Company ran out of cash in 1799, it turned to its stockholders for ideas about how to raise more. When their ideas did not produce enough to finish an important series of locks, the managers suggested increasing the company’s capital by levying an additional $100 on shares that were already fully paid in. Before they could do so, however, they had to win the consent of most shareholders, engineer a buyout of holdouts, and obtain legislative approval.130 Similarly, in October 1798 the stockholders of the Middlesex Canal met to consider whether “the Directors shall be authorized to hire Money to finish the Canal the year ensuing.”131 The directors of New York’s canal and lock companies, by contrast, thought nothing of mortgaging the completed parts of the works to raise cash to finish its route when stockholders proved reticent to fully pay for their shares quickly.132 While directors in some companies could borrow without the explicit approval of stockholders, corporations that offered additional shares (equity) for sale generally had to offer them to existing stockholders first, so stockholders could protect their pro rata equity and voting position if they wanted to.133

Such restrictions on managerial discretion were important because by the 1790s U.S. capital markets were quite sophisticated. In 1794, for example, the Schuylkill and Susquehanna Canal Company issued a convertible preferred stock. Holders were to receive 6 percent per annum, payable quarterly, plus their proportionate share of any dividends paid to common stockholders. They also had the option of converting their preferred shares into common stock if the company issued more of the latter during the 13-year contract period.134 Rapacious managers (or majority stockholders) could have used such instruments to bilk investors. Charter restrictions, however, limited the scope of scams as did other requirements, such as that any major change be approved by stockholders and that dividends be paid out of operating profit and not capital.135
Stockholder activism also kept managers and majority stockholders in check. Stockholders in the 1790s did not spend all their waking hours monitoring their investments but they were certainly more activist than investors were in the 1930s, when Adolf Berle and Gardiner Means complained that ownership and control had separated, that managers called the shots while rationally apathetic shareholders looked on. In 1800, for example, stockholders in the Hartford and New Haven Turnpike monitored management by appointing a committee of three men, Heman Swift, Epaphroditus Champion, and Jonathan O. Moseley, to inspect the road. The trio dutifully submitted a detailed 49-point report urging the directors, due to the “immense importance” of the road, to make improvements like lowering all grades to at least 5 degrees, filling in low-lying areas, improving drainage, and building up walls and banks.

Dividend policies – the presumption was that profits would be paid to stockholders at regular intervals – also aided in governance by denying managers the means of undertaking self-serving or untoward activities. Because they were not supposed to be paid out of capital, only out of profits, dividends were also important pieces of information for stockholders and would-be investors. Early stockholders could be very well informed about the status of the corporation if they wished to be. Full public disclosure was a product of the late twentieth century and was not obviously superior to the early form disclosure took, which was selective and private. In 1799, for example, the president and directors of the Potomack Company wrote stockholders a circular letter detailing the company’s accomplishments, challenges, operations, and financial situation. Tellingly, the directors noted that they thought it “incumbent” upon themselves to provide stockholders with accurate and timely information. It was indeed incumbent upon them to provide information to stockholders who requested it because they were clearly just the owners’ elected agents. Stockholder rights to information were not unrestricted
(especially in the case of banks) or uniform, but generally stockholders could view the corporation’s book at frequencies ranging from annually to continuously. 142

Corporations could also go public with information if they wished. In 1792, Philip Schuyler, president of the Northern and Western Inland Lock Navigation Company, decided he had to publish the reasons that construction progress on the canal was slow. 143 A few years later, the company again went public with its troubles, though perhaps more to curry political favor than to attract additional private investment. 144 Early corporations also often published their charters and by-laws. The Bank of the United States did so, for example, likely to show potential investors that the directors had constructed elaborate rules and regulations designed to keep shareholders safe and big dividends flowing. 145 Numerous other companies did likewise. 146

Because early stockholders usually asserted their rights as owners, many early directors were careful to keep their interests in mind when making important decisions. The directors of the Schuylkill and Susquehanna Company, for example, declined to enter into a contract with the state of Pennsylvania to build a canal around Conewago Falls because they thought the risk too high to impose on their stockholders. So instead they spun off a company specifically organized to do the work. And good thing, too, as the cost of the locks alone far surpassed the initial allowance. 147

None of this is to say that early directors were mere marionettes. They could, and did, push back when stockholders were obviously biased or just plain delusional. For example, Schuyler patiently explained to shareholders that it would not be prudent to run up expenses simply because the company’s charter allowed it to make dividends of 15 percent “on all their expenditures.” “This appears plausible in theory,” he granted, “but may and probably will be found fallacious on actual experiment” because tolls (to wit, company revenues) would not be
sufficient to pay such high dividends for many years. Tolls would have to be less than the cost of overland transportation, otherwise the river improvements “would have no beneficial object to the community” and the area’s population, while growing, would not be sufficient to generate high revenue for some years. Maintenance expenses also had to be factored in, he noted. He concluded that completing the improvements “on a scale more extensive than what is indispensibly [sic] necessary, would be injurious to the reputation of the company” by forcing it to charge high tolls. “It ought to be the invariable pursuit of the company,” he opined, “so to conduct its operations as that its interests and those of the community may go hand in hand.”

The Benefits of Big

Big businesses suffered from internal agency problems, but, as discussed above, not intractable ones. Large size also brought big benefits, including market power (control over input costs and output prices via vertical integration or market share), economies of scale (horizontal integration leading to the lower per unit costs typically associated with larger production facilities), and vertical integration (including more of the production and distribution process within the business, rather than purchasing inputs or distribution services in the market). Each strategy required that businesses grow to a large size relative to traditional firms. Although proprietorships and partnerships occasionally grew to great size, it was costly for them to do so. Proprietors had to generate equity capital themselves. They could borrow but usually only for short periods and rarely for more than a few years. Bonds and mortgages could run for decades, but after a year or two they usually became callable, to the great risk of the borrower. Moreover, creditors frowned upon highly leveraged operations due to interest rate and, in this pre-life insurance environment, mortality and morbidity risks. Unless they controlled their own banks, few entrepreneurs would or could venture big by borrowing or by using only their own funds and
those of a few close compatriots. Large size almost demanded incorporation. “The multiplication of corporations, and the avidity with which they are sought,” wrote famed New York jurist James Kent, “have arisen in consequence of the power which a large and consolidated capital gives them over business of every kind.”

Corporate market power sometimes flowed directly from government decree. More often, however, it stemmed from relative size and an early form of branding. The Beverly Cotton Manufactory, for example, obtained a trademark for its seal, which it affixed to its products like its soon famous Beverly corduroys. After the Bank of Alexandria organized and launched successful operations it appealed to the state legislature not for exclusive banking privileges in Northern Virginia but rather for an increase of its capital and for the right to issue notes of less than $5 denomination for the “convenience of the planters, farmers, and mechanicks,” especially in “country places” where small change was often in short supply. Small notes earned seigniorage but also spread the bank’s name and fame far and wide.

To attract large sums of capital, long-term or “locked in” debt and equity, entrepreneurs turned to the corporate form, which offered investors five major advantages over other types of organization. First and foremost, corporations enjoyed perpetual succession. That did not mean that corporations were guaranteed to survive forever or even that their charters extended to the end of days. In fact, a few early corporate charters were perpetual but most were limited to a specific number of years. Also, in most states, corporations could dissolve of their own accord. Rather, succession meant that shareholders and managers could come and go without forcing the dissolution of the enterprise, that “the body continues the same, notwithstanding the change of the individuals who compose it.” Succession provided a big advantage over partnerships, which had to dissolve and re-form whenever a partner joined or left the firm. It was
also advantageous in some lines of business where customers had to account for the mortality, morbidity, and credit risks posed by sole proprietors.\textsuperscript{158} During the 1790s, for example, incorporated marine insurance companies increasingly took market share away from old style brokers, making particularly rapid gains during the Quasi-War against France. Corporations were more likely to pay claims than individuals because they had larger capitals and were more robust in the face of shocks like yellow fever epidemics. Moreover, they proved just as good as individual underwriters at combating adverse selection and moral hazard, the two great banes of insurers.\textsuperscript{159}

Corporations were also afforded the presumption of state non-interference. Those that did not begin operations in a prompt manner could have their charters revoked by the government after due process. Sometimes charters explicitly specified how long the corporation had to begin operations; other times, the matter was left up to later negotiation.\textsuperscript{160} In no instance countenanced by early jurisprudence, however, could government capriciously seize, terminate, or substantially alter the charter of a business corporation unless it explicitly reserved the right to do so in the charter.\textsuperscript{161} The glaring exception, Pennsylvania’s revocation of the Bank of North America’s charter, was never tested in court because the bank was satisfied to secure a new, albeit less generous, act of incorporation in 1787. Massachusetts took the less objectionable path of modifying the charter of its first bank, the Massachusetts Bank, over time as it became clear that the original charter was not up to best practices.\textsuperscript{162}

Second, a corporation could also sue and be sued in its own name.\textsuperscript{163} (In the late eighteenth and early nineteenth century, corporation names were more flexible than today. As Angell and Ames noted, “the name of a corporation, frequently consists of several words, and the transposition, interpolation, omission, or alteration of some of them may make no essential
difference in their sense.”164) Thanks to a New York Supreme Court decision in 1799, corporations could sue without exhibiting their charters or listing the names of shareholders.165 Subsequent jurists deftly dodged some legal niceties about the definition of “person” and “citizen” to ensure corporations close to full and equal access to federal courts and courts in states where the corporation was not domiciled.166 That made it cheaper for a corporation to collect debts owed to it than a similarly sized co-partnership, which had to sue in the name of all partners. To sue or be sued the partnership needed the active participation of all the principals, which was often inconvenient and always costly. Partly for that reason, most early American partnerships had four or fewer members, usually all resident in the same city, and often related by birth or marriage.167 All else constant, creditors also recovered debts from corporations more easily than they could from partnerships.168

Of course, all else was not always, or even usually, constant. Corporations were much more likely to extend limited liability to its owners than partnerships were. Limited liability, the third great advantage of the corporate form, ostensibly injured corporations’ ability to borrow but greatly aided its ability to attract equity financing.169 The unique structure of the primary or issuance market for shares constituted the fourth advantage of the corporate form, and the creation and perpetuation of active secondary markets in corporate equities was the fifth. Both receive more detailed discussion below.

**Limited Liability and Entity Shielding**

In only two cases, the Hamilton Manufacturing Society of New York and the Salem Iron Factory Company of Massachusetts, did early charters mandate full stockholder liability.170 In the Maryland Insurance Company, stockholders were made proportionally liable for the corporation’s debts. (In other words, if a shareholder owned 10 percent of the outstanding shares...
when the company went bankrupt, he or she would have to pay 10 percent of any of its debts remaining unpaid after its assets had been liquidated.) In their classic article on the origins of the business corporation, Oscar and Mary Handlin baldly assert that corporate charters by default mandated full stockholder liability. In other words, unless a charter explicitly provided otherwise, in the event of corporate bankruptcy creditors could recover all they were due from any stockholder or stockholders. Since most early charters did not contain an explicit clause limiting shareholder liability (16 expressly provided unqualified limited liability for shareholders while another 16 imposed full liability on directors and/or shareholders only if certain financial ratios were exceeded), the Handlins reasoned, limited liability must have been of only “slight importance” to early stockholders.

More recent research questions the Handlins’ analysis. According to the new view, stockholder liability in the early United States was limited de facto. In other words, unless explicitly altered by statute, investors and observers widely considered shareholder liability to be limited to the par value of the stock owned by each. The Handlins themselves admitted that whatever its legal status, liability was not tested in the courts because most early corporations did not impose losses on creditors. Legal scholar Edwin Dodd concurred, noting that reported case law on corporations in America prior to 1800 was extremely scanty. After several corporations failed following the War of 1812, courts finally definitively ruled that absent an explicit charter clause to the contrary, the limited liability of stockholders was assumed. Thereafter, limited liability clearly became ensconced in the American corporate scene. In Massachusetts, Georgia and some other states, however, double, treble, proportional, and even full liability for shareholders in certain types of corporations, sometimes banks but more often mining and manufacturing companies, was often explicitly mandated.
Evidence supporting the new view of de facto limited liability in the 1790s abounds. When commenting on the repeal of the charter of the Bank of North America, Robert Whitehill noted that he was “not surprised” the stockholders were “so solicitous to procure another charter for the bank. While it has no charter, their private circumstances are liable to account for any deficiencies.” The Bank apparently agreed, obtaining a charter from Delaware, just in case. Before it received the official sanction of the state, the Bank of New York had some difficulties attracting investors who feared that they could be held personally responsible for the bank’s debts should it fail. In 1793, “Mercator” argued against the incorporation of a marine insurer on the grounds that the stockholders would receive limited liability, a gift that would provide it unfair advantage over individual underwriters. America’s earliest corporate law treatise unequivocally stated that “no rule of law” was “better settled, than that, in general, the individual members of a private corporate body are not liable for the debts, either in their persons or in their property, beyond the amount of property which they have in the stock.” Adam Smith also unequivocally noted that in partnerships “each partner is bound for the debts contracted by the company to the whole extent of his fortune” but in a joint-stock corporation “each partner is bound only to the extent of his share.” “The estate and rights of a corporation belong so completely to the body,” a nineteenth century commentator argued, “that none of the individuals who compose it can dispose of any part of them.” Therefore, the commentator continued, “what is due to the corporation is not due to any of the individuals who compose it, and vice versa.”

Early widespread adoption of limited liability (de facto or de jure) helped the U.S. economy to steer clear of a trap that ensnared the British economy in the latter half of the nineteenth century. Corporate creditors disliked limited liability because it limited the pool of income and assets from which they could demand repayment. They responded by insisting that
directors or prominent shareholders pledge their personal estates as well or by charging a risk premium on corporate bonds. In the United States, most corporate shareholders enjoyed de facto limited liability, so those who wished to lend to American corporations had little recourse. Competition among lenders kept risk premiums or demands for personal collateral low; there was no presumption that a company with limited liability was weak. In Great Britain, by contrast, corporations could choose their liability status. Higher quality firms typically chose full liability while lower quality ones typically chose limited liability, or so bond investors widely believed. Full liability corporations therefore found it much cheaper to borrow than limited liability ones did, inducing many firms to maintain their full liability status and raising the cost of capital for others, whether justly or not. That may explain in part why Britain’s economy lagged behind that of the United States and other countries where limited liability developed and proliferated more rapidly.¹⁸⁵

Scholars sometimes argue that limited liability merely transferred risk to creditors. It certainly did; that was the point. Those scholars go too far, however, when they conclude that limited liability was inconsequential. It actually reduced risk. Lenders and other creditors were senior to stockholders and their liability, as it were, was always limited to the amount of their loan. In other words, in case of default or bankruptcy they had first dibs on the corporation’s assets and had no fear of being called on for more. With full liability, each shareholder had to worry about paying all of the corporation’s debts, however remote that possibility might be. Buying a share with full liability was a bit like buying a lottery ticket where one might by chance draw the obligation of paying off the winner! Not many people would prize such a dubious opportunity.¹⁸⁶ Limited liability leveled the playing field. Stockholders were still junior; they bore the residual risk of bankruptcy. With limited liability, however, they no longer had to factor

³₀
in the probability of losing all their assets. That undoubtedly had a large, positive impact on share demand and liquidity, lowering the cost of equity capital.\textsuperscript{187} Limited liability was therefore a Pareto improvement because it made some groups better off (stockholders, the corporation itself) while rendering no one worse off (because creditors were free to increase the cost of credit to reflect limited liability).\textsuperscript{188}

Limited liability protected shareholders when a corporation failed. Entity shielding, by contrast, protected the corporation from the bankruptcy of one or more of its stockholders and, by extension, protected shareholders from each other. Thanks to entity shielding, neither the corporation nor its shareholders needed to know or care about the identity of its investors. That, in turn, allowed corporations to accept anyone who bought their stock without vote or cavil.\textsuperscript{189} That, of course, increased the liquidity of equities and hence demand for them both at the time of issuance (the primary market) and thereafter (the secondary market). Partnerships also enjoyed some entity shielding but the corporate shield was much more robust.\textsuperscript{190}

**Primary Markets**

Most early U.S. corporations were start-ups, new companies with little or no operational history.\textsuperscript{191} Early corporate entrepreneurs were able to go public before beginning operations for four reasons. First, even the nation’s largest cities were geographically and socially compact. Entrepreneurs and potential investors knew each other, often quite well, or at least knew of each other. In fact, most early corporate securities sales were direct public offerings (DPOs) rather than initial public offerings (IPOs). In other words, corporations sold securities directly to the public, not via investment banks. To do so, they advertised the time and place of subscription, and sometimes their general business plans, by word of mouth, broadsides, and newspaper advertisements.\textsuperscript{192}
Second, DPOs were largely unregulated, allowing entrepreneurs to engage in selective disclosure, as in private placements today. Selective disclosure mitigated one of the major costs of full disclosure public offerings. Some investors could learn important details of the business plan while others, suspected competitors, were told little, perhaps only the names of the people who had already subscribed. Entrepreneurs were loathe to withhold that information because a list of good names could jumpstart demand as smaller investors looked to follow the “smart” money. “From the respectability of the characters who already subscribed,” a New York paper noted of a 1792 canal DPO, “we have reason to congratulate our fellow-citizens in the prospect of the respective subscriptions being speedily and substantially filled.” The paper was a little too sanguine but the number of subscriptions did jump despite the monetary stringency caused by the Panic of 1792.

Third, a culture of activist corporate governance, prudent mean stockholder voting rules, and legal restrictions against corporate activities that served to mitigate agency problems protected the rights of minority stockholders. Early corporations clearly wanted, and needed, all of the equity investment they could get. Strong protection of the rights of small stockholders, many of whom were women, was therefore paramount.

Fourth, early U.S. corporations in their DPOs typically sold de facto call options on shares rather than the shares themselves. Subscribers initially made a down payment, as low as a dollar or two per share. The Bank of Rhode Island, for example, took at subscription just $5 for every $200 par value share. After the company organized, corporate officers called in all or part of the par value of the share in installments. The $10, $25, $50, $100, or $1,000 par value per share was not fully paid in until some weeks, months, or years after the corporation began business, giving investors some idea of its operations before they were “all in.” The Middlesex
Canal, for example, called in its capital stock in 100 different assessments ranging from $2.50 to $10 per share. Subscribers usually could walk away by selling their options to other investors. The most (in)famous of these markets for “scrip” was that of the Bank of the United States. The subscription in any joint-stock corporation was tradable but not necessarily easily so if money market conditions changed or the company faced operational difficulties. If no buyer could be found, subscribers generally could forfeit their shares. Directors had considerable discretion regarding when and if they called for installments and what happened to shareholders who did not pay up. The directors of the Charles River Bridge, for example, gave 15 days’ grace after which it levied interest at “Five per Cent. per Month.” After 4 months, unpaid shares “and all the Monies he has before advanced” were forfeited to the corporation. It was extremely difficult, however, for corporations to force subscribers to pay for their shares, hence the de facto call option nature of the obligation.

Unincorporated joint-stock associations selling de facto options faced legal barriers. They could not sue delinquent members because courts saw them as both a plaintiff and a defendant; members could voluntarily withdraw from the association. Chartered companies, by contrast, could and did sue subscribers who missed installment payments on their shares when they formally agreed to pay all their installments on time or suffer explicit penalties. When faced by a mass defection of stockholders, the Delaware and Schuylkill Canal Company asked the courts to enforce just such an agreement. The directors and leading stockholders (presumably those who had fully paid up) argued that share forfeiture would not serve the company because its works were already well underway. “All those immense sums of money, already advanced will be totally lost,” they argued, “and the wreck of the canal, exhibit a lasting monument of folly; and even prevent other enterprises worthy of great minds.” They
seemed to worry about their ability to collect, however, so they also argued that if delinquent stockholders would only examine the canal’s affairs they would see that the investment was still solid. When some still refused to pay, Pennsylvania courts upheld forfeiture of shares purchased in the secondary market and fines for original subscribers. Similarly, work on an early New York canal halted when stockholders failed to meet directors’ calls “either because they had not the means to supply such advances, or from an apprehension of the impracticability of succeeding in the operation.” An infusion of government funds bolstered confidence in the project, however, and the canal was eventually completed.

Assured that they could sell their shares for a fair market price whenever they needed too, early Americans usually purchased share options in DPOs with alacrity, providing corporations with the equity capital that they needed to commence and continue large scale operations.

**Secondary Markets**

Liquidity of ownership stakes was another advantage because it allowed stockholders to increase, decrease, or maintain their holdings in specific enterprises as they saw fit and to borrow money by posting shares as collateral. Liquidity also provided stockholders with the opportunity to “vote with their feet.” Selling out freed individual investors from situations they did not like and, if enough shareholders felt similarly, decreased share prices and hence the cost of takeover by a new control group. Most judges realized this and generally used the power of the bench to ensure the full and easy transferability of corporate shares. Thanks to those rules, equities of major corporations, including the Bank of the United States, traded in European capital markets like London. Courts also made it relatively easy for people to hypothecate equities or, in other words, to use them as collateral for loans.
Corporate securities ownership was not limited to the rich, or even the well-to-do. Many people of middling means bought a share or two in local banks, turnpikes, and other corporate enterprises.\textsuperscript{215} Most early U.S. corporations had scores or hundreds, rather than just a few shareholders. Ninety-one different people invested in the Charles River Bridge in 1785; 50 different people purchased the 120 shares offered in the Malden Bridge Company in 1787.\textsuperscript{216} At one point in the 1790s, 309 different entities, mostly individuals but also a few corporations, partnerships, and non-profit organizations, owned shares in the Bank of Pennsylvania.\textsuperscript{217}

In a few cases, surviving corporate records allow us to detail changes in stock ownership.\textsuperscript{218} In other cases, the existence of liquid secondary markets can be inferred with confidence from the regular publication of stock prices in contemporary newspapers.\textsuperscript{219} Finally, we know from the large size and frequent trading of U.S. government bonds that the financial infrastructure requisite to trade any corporate security – brokers, dealers, exchanges, and the like – were in place by the early 1790s.\textsuperscript{220} By the end of the 1790s over a dozen different corporations purchased U.S. government bonds themselves.\textsuperscript{221}

**Corporations and Economic Growth**

After passage of the Constitution, “a laudable spirit of emulation” suffused the nation, including both the “Agricultural and Commercial States of the Union,” the citizens of which soon undertook “the improvement of their respective territories, and transportation of their produce to the proper markets, by means of INLAND NAVIGATION and good ROADS.”\textsuperscript{222} A vigorous spirit of enterprise was not unknown in colonial America,\textsuperscript{223} but it was much more muted and limited than the spirit of entrepreneurship that swept the nation after passage of the Constitution. Part of the spirit stemmed from the realization that Americans needed services, particularly financial ones, no longer easily available from Britain.\textsuperscript{224} Another cause arose from
the improved protection of property rights afforded under the Constitution. Much of the new entrepreneurial spirit gravitated toward relatively large scale projects. “Not until the new government under our present Constitution came into active operation in the spring of 1789,” wrote historian Simeon Baldwin over a century ago, “was a fair field open for the permanent investment of capital in large operations with the assurance of safety as could command general public confidence.”

As historian Joseph Davis pointed out some 9 decades ago, “the period is one merely of beginnings. Yet before 1801 a substantial basis had been laid upon which the nineteenth century could build.” Yet according to historian Pauline Maier, “social and economic development could have been accomplished in other ways,” without developing the corporate form. That is undoubtedly true but should not be taken to diminish the economic importance of early corporations. Some large scale enterprises could be successfully undertaken without creating a corporation. Not all toll bridges were owned and operated by corporations, for example. Numerous bridges in Virginia were owned and operated by proprietorships or partnerships. In New Jersey in 1791, the government auctioned off the right to build bridges and collect tolls over the Passaic and Hackensack rivers to the highest bidder, the person or firm that would accept the shortest lease period. Interestingly, however, some of those firms later incorporated and New Jersey later chartered numerous bridge companies. Similarly, a small group of entrepreneurs in South Carolina discovered it was far too expensive for them to clear Pine Tree Creek as thoroughly as they hoped. In order to finish the project, they prayed to be incorporated so that investors could be “admitted upon equal and safe terms.” The legislature agreed, giving rise to the Pine Tree Creek Navigation Company in late 1797. Entrepreneurs heading up larger enterprises, including larger bridges and river improvements, knew from the start that they
needed the corporate form in order to attract enough long-term capital to make a go of it. Without the corporation, entrepreneurs would have been forced to find more costly ways of raising capital or to forego larger or riskier projects completely.

Entrepreneurs did not generally risk their time, reputation, fortunes, and, in an age of debtors’ prisons their freedom, without the prospect of considerable gain. Large projects held out two inducements to early entrepreneurs, market power and scale economies, which combined spelled the opportunity for large profits (high prices coupled with low costs). While entrepreneurs struggled to grow rich, Adam Smith’s invisible hand took over, rendering their selfish greed socially beneficial as they created new technologies, developed new industries, and made production processes more efficient. Taking a broader view, the rise of the corporation nation helped to ensure that the United States developed and maintained a system of “good capitalism,” a healthy mix of smaller startups and efficient, well-established industrial giants. While not without its flaws, such a system is far better for economic growth, and hence individuals and their governments, than the various forms of “bad capitalism” that flourished elsewhere.232

Modern management is generally considered a product of the second half of the nineteenth century. That may be true, but already by the 1790s corporate managers were learning how to run large enterprises efficiently.233 After some initial difficulties, banks by 1800 were generally very well managed.234 Less is known about the management of insurance companies but there is little reason to question their competence.235 They were astute enough, for example, to urge state and local governments to construct lighthouses, install navigation buoys, and pass basic fire safety legislation.236 Bankers and insurers made mistakes to be sure but anyone conversant with recent events knows that they remain far from infallible.
Canals and turnpikes were often completed late and over budget, but that is not uncommon even today. Early canal and turnpike companies often made a hash of things for two main reasons. First, large-scale construction experts, particularly experienced engineers, were few. At least two of those who emigrated from Europe, John Senf and Pierre L’Enfant, were more like artsy architects than solid civil engineers. Second, laborers, even the unskilled, were expensive and uppity, and supervision was often lax. Even though they paid efficiency wages, the Potomac Company found that its laborers manifested a “turbulent and insubordinate spirit” so strong that “the work that was directed to be done was either entirely omitted or but partially performed.” Attempts to bolster the labor force with indentured servants and slaves backfired as tensions between the three types of laborers mounted and many servants fled. Gunpowder began to go missing and neighbors complained of ill treatment. Conditions eventually improved on that and other projects but labor-management difficulties persisted.

When things got tough, early American managers tended to squabble amongst themselves rather than work together to fix the problem. On the Potomac canal, for example, the assistant managers regularly bickered, quarreled, and hurled insults at each other in an apparent attempt to curry favor with the company’s directors. Early managers usually learned on the job, but they did learn. Instead of repeating the woes of the Potomac Company, the James River Company used slaves or contracted jobs out to smaller firms.

Cost estimation techniques, though still primitive by later standards, also improved with experience. The Cooper and Santee River canal in South Carolina ended up costing three times its original estimate. Such overruns prompted one early observer to advise doubling engineer estimates “in order to provide against contingencies.” Another committee explained that “in works of this kind [canal construction] where many men are employed, worthless characters will
introduce themselves notwithstanding every attention to prevent it; accidents will intervene, tending to retard the business.” It therefore padded its cost estimate of £72,350 by £7,650, which was a little more than the 10 percent padding suggested by experienced British engineer William Weston.245 Perhaps more importantly, the committee noted that tolls would be less than the “market rate of interest” (approximately 7 percent) on £80,000 so “the Stockholders will be sufferers”246 unless the legislature cut the company some slack regarding the width and depth of the canal. Architects also warned of massive cost overruns, “especially in buildings of a public nature.”247

Early directors had some idea about how to keep expenses down. A committee of the Western Inland Lock Navigation Company, for example, realized that it needed to delegate considerable operational power to a single strong manager, someone who could engage in comprehensive planning so “that supplies may be prepared, without incurring that extra expence which ever attends collections made on the spur of the occasion.” “To find such a character,” the committee admitted, “is certainly not very easy” but at least they were looking.248 The Middlesex Canal Company apparently found one because its extensive works – over 27 miles of canal, 20 locks, 7 aqueducts, and over two score bridges – came in only slightly over budget, despite the fact that like many early canals it at first built economically inefficient wooden locks instead of stone ones (which still stand in some places).249

After much time and expense, some canal companies eventually got the job done, bestowing the benefits of cheaper and faster transportation to the farmer, merchant, and manufacturer alike. By 1799, for example, the Potomac Company had made it possible for boats laden with 100 barrels of flour to navigate the Potomac River from George’s Creek to the tidewater with only a single portage around the Great Falls.250 The canal at Conewago Falls in
Pennsylvania also worked well when finally completed, reducing the amount of time it took to negotiate the falls fully laden from many hours and dollars to about a half an hour.\textsuperscript{251} By 1800, the James River Company had improved the navigation of its namesake some 45 miles. By 1816 that figure had grown to 300 miles, at the cost of only $1,200 per mile, a figure low enough to allow it to pay handsome dividends.\textsuperscript{252} From South Carolina to Massachusetts, other canals, most owned and operated by corporations, eventually opened for business, greatly aiding the size and efficiency of local and regional markets.\textsuperscript{253}

Bridges usually fared quite well. Even the large ones typically constructed by corporations were easy to build and manage relative to canals. (Smaller ones were handled by local road crews, individual proprietors, turnpikes, and so forth.) Damaging floods and ice were their biggest foes. Like canals, bridges aided the economy and improved market efficiency by lowering transaction costs. Far better to traverse a bridge than to ford an icy river or wait for the ferryman, especially along important thoroughfares like the York road that connected Manhattan to Philadelphia via New Jersey.\textsuperscript{254}

Far better, too, to travel a well kempt turnpike than rutty local roads. Larger and more difficult to construct and keep in good repair than bridges but easier to build and maintain than canals, turnpikes not surprisingly generally suffered more financial, engineering, labor and other problems than bridges but fewer than canals. Most new turnpikes successfully raised cash via DPOs, completed their roads, and remained in business for decades. Some were financially successful, but many found it difficult to collect enough tolls to cover the cost of road repair and gatekeepers.\textsuperscript{255}

Some early manufacturers also struggled. Management and labor difficulties plagued the Society for the Establishment of Useful Manufacturers, for example, eventually bringing it to its
financial knees. But it later recovered and other manufacturers got on well from the start.

America in 1800 was still a nation of farms and plantations but industrial output was growing fast and would continue to do so throughout the nineteenth century. Many manufacturing concerns were still small, ranging to a corner of a farmhouse with a spinning wheel or a small nail forge to a mill employing a dozen hands. Much of the growth in manufacturing, however, was aided by corporations. Growth in other modern sectors, including mining, transportation, and financial services, was also largely attributable to the net benefits entrepreneurs discovered, laying mostly latent, in a hoary institution inherited from the Old World. “The minds of men,” wrote Bostonian Harrison Gray Otis in 1807, “teem with projects. … Hence bridges, turnpikes, canals, houselots and every species of property are under some aspect or another objects of speculation.”

</table>

**Note:** I count original charters only, not laws reviving existing charters or laws that merely validate corporations already chartered by another state. I was able to verify almost all of the charters found by Davis (1917). I include one organization that he dismissed as a charity while myself removing another (very charity-like) organization that he believed to be a for-profit corporation. I found one turnpike in Connecticut not listed in Davis. Future research may uncover additional charters but it is highly unlikely that any significant number of business corporations chartered prior to 1801 have been missed. Of the 319 business corporations tracked in the table above, I found positive evidence that 15 of them never began operations. For most others, ample evidence from subsequent laws, newspaper notices, letters, and other contemporary sources exists. No systematic effort, however, has been made to verify the operation of the other corporations. Most early corporations performed only one activity. A few, however, engaged in two or more activities, for example bridges and turnpikes or fire and marine insurance. They are categorized in this chart according to what appears to have been their primary activity.

**Sources:** Simeon E. Baldwin, “American Business Corporations Before 1789,” *Annual Report of the American Historical Association for the Year 1902* (Washington: GPO, 1903); Joseph Stancliffe Davis, *Essays in the Earlier History of American Corporations* Vol. 2 (Cambridge: Harvard University Press, 1917). Sundry state session laws, acts and resolves, and statutes at large were also consulted, as were state archival records and published charters and by-laws when available.
Notes

1 This essay was written with the aid of research grants from the Berkley Center for Entrepreneurial Studies and the National Science Foundation (SES-0751577). All errors of omission and commission, however, remain the sole responsibility of the author.

4 They were not annulled by the Revolution, “for the dismemberment of empire, it is well settled, caused no destruction of the civil rights of individuals or corporate bodies.” At least one, the Philadelphia Contributionship, survives to this day. 9 This is the count of all persons named in early acts of incorporation as incorporators or stock subscription agents.
Many individuals were involved in more than one corporation but undoubtedly many others were involved in
corporation formation who were not explicitly mentioned in legislation, which did not always provide the names of
incorporators.

10 This analysis answers the questions raised by Oscar Handlin and Mary F. Handlin, “Origins of American Business
Corporation,” Journal of Economic History 5 (May 1945), 1-23. The same net benefit framework can also be used to
analyze why entrepreneurs chose the particular form of incorporation that they did. For-profit corporations came in
three major varieties, joint-stock, mutual, and mixed. Stockholders owned joint-stock corporations; depositors,
policyholders, or other types of customers owned mutuals. Mixed business corporations were partly owned by
stockholders and partly by customers. In the 1790s, most American corporations took the pure joint-stock form but several insurers opted for the mutual form.

26 “To the Honourable, the Legislature of the State of New York, in Senate and Assembly Convened. 158 Succession and protection from individual idiosyncratic risk also played important roles in the transition from private to joint stock banks in Britain in the second quarter of the nineteenth century. Lucy Newton, “Change and Continuity: The Development of Joint Stock Banking in the Early Nineteenth Century,” Working Paper, Centre for International Business History, University of Reading, n.d.

167 “It is uncommon for a partnership to consist of more than three or four individuals; two is the most usual number.” “Manufacturing Corporations,” *American Jurist* (July 1829), 110.

171 Unless their charters explicitly provided otherwise, corporations could not assess stockholders for more than the par value of their shares so liability for solvent corporations was inherently limited. Joseph Angell and Samuel Ames, *A Treatise on the Law of Private Corporations Aggregate* (Boston: Hilliard, Gray, Little & Wilkins, 1832), 302-3.

180 Alexander Hamilton’s attempt to build limited liability into the bank’s articles of association was never tested because the bank never failed. In fact, it still operates today.

186 For an excellent discussion, see “Manufacturing Corporations,” American Jurist (July 1829), 105-7, 115-16.

188 The only exception would be involuntary creditors, like tort victims, but such cases were rare in the eighteenth and early nineteenth centuries. They are more common today but are probably best handled through other, possibly government-sponsored, means. David Moss, When All Else Fails: Government as the Ultimate Risk Manager (Cambridge: Harvard University Press, 2002), 74-75, 81, 84.

197 “Charter of the Rhode-Island Bank,” (1795), 2.
199 See, for example, the stock transfer ledgers of the Upper Appommatox Company, Virginia Historical Society, especially the transfer from John Hurt to Henry Moss on 20 May 1797 and the transfer from Thomas Read to John Haskins on 15 January 1803.
202 John Austin, Jr., “Charles River Bridge,” (Boston?, 1785).

Most were banks or insurance companies like the Bank of Providence and the Providence Insurance Company. Between December 1791 and December 1800, the Bank of Providence purchased $350,590.13 par value of federal bonds, mostly in the form of Sixes, in 159 different transactions. Over that same period, the bank sold $90,070.52 worth of federal bonds in 17 transactions. On December 9, 1794, the bank sold almost $38,000 par value of bonds. In a single week the following May, it liquidated over $12,000 more. The large sales most likely indicate that the bank thought of the bonds as secondary reserves, a safe but remunerative asset easily and cheaply exchanged for cash when needed. Between November 1799 and November 1800, the Providence Insurance Company purchased $113,315.08 par value of federal bonds, mostly Sixes but some Deferreds, Threes, and Eights as well. Over that same period it sold $17,660.47 of those bonds in 14 clustered transactions, again indicating the use of the bonds as a form of reserve. Most of the other financial institutions that owned federal bonds in the 1790s followed a similar pattern of trading. Some charters, including that of the Boston Marine Insurance Company, mandated that the corporation invest in government bonds, B.U.S. stock, or other bank shares. Not all corporate purchasers of government securities were financial companies, however. The Society for the Establishment of Useful Manufactures and the Potomac Company also found it convenient to own safe, liquid, but remunerative assets and in the nineteenth century, numerous turnpikes, bridge companies, and other non-financial business corporations also owned federal bonds at times.
