## APPENDIX C

### Prices of Individual Commodities and Commodity Groups

---

The price indexes compiled in this study are presented here, together with Bureau of Labor Statistics price series. In the reporting of the NBER price series three basic numbers are presented:

1. The unweighted index of prices for the commodity
2. The annual average number of month-to-month pairs of price series on which the index is based.<sup>1</sup>
3. The annual average of standard deviations of month-to-month relative changes in individual prices from the average change in the index for the product. (See p. 40, footnote 3.)

The average number of reporters tells something of the statistical basis of the index. The standard deviation of the price changes is a measure of the cohesiveness of the price pattern: a value of zero would indicate strict proportionality and simultaneity in the price movements of the individual series.

These data are given for the sixty-four commodities for which we had an average of three or more reporters; other commodities' indexes are omitted because of promises of confidentiality. In addition group indexes are given.

<sup>1</sup> This number, it should be noted, is often a minimum count. When a state buys fuel oil for ten hospitals, we combine the individual prices into a single price index for that buyer.
