Chapter pages in book: (p. 7-17)

## CHAPTER I

## THE EXPENDITURES OF CITIES

Municipal expenditures for public works in this country have grown with great rapidity during the past ten years. This growth is in part due to the rapid rate of increase in the urban population of the United States, and in part to the rising standards of living of American cities.

The rate of increase of our urban population is a well-known feature of American population growth during these many decades, and seems to be continuing without interruption. Since 1910, as the following tabulation shows, the numbers living in cities with a population of 30,000 and over increased from less than 30 per cent to 36 per cent of the total population of the country, ${ }^{2}$ in the face of a substantial rise in that total.

| Year | Total <br> Population <br> United States <br> (thousands) | No, of <br> Cities of <br> 30,000 <br> and over | Population <br> In Cities <br> of 30,000 <br> and over <br> (thousands) | Per Cent of <br> Total Population <br> in Cities of <br> 30,000 and over |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| 1910 | 91,972 | 184 | 27,316 | 29.7 |
| 1920 | 106,422 | 247 | 36,654 | 34.4 |
| 1922 | 109,893 | 261 | 38,737 | 35.2 |
| 1924 | 113,727 | 248 | 39,981 | 35.2 |
| 1926 | 117,136 | 250 | 41,840 | 35.7 |
| 1927 | 118,628 | 250 | 42,716 | 36.0 |

The accelerated rate of growth of the American city, particularly of the large cities, has necessarily left municipal governments far behind in their programs to provide the equipment required by an increasing population. Congestion of population has caused municipal governments to fall far behind in their plans for the development of adequate transportation facilities. An increasing

rate of water consumption likewise has made necessary extensions and improvements in the existing plant and the utilization of more remote supplies of potable water, involving rising expenditures for construction. Pressure of population thus produces a wide range of needs, that have led inevitably to rapid growth in the size of the plant and equipment of the typical American city.

Most American cities are, further, centers of industry and commerce. The prevailing level of wealth and income is notably higher in our urban than in our rural areas, and has tended to become relatively more so. Municipal expenditure for public improvements, consequently, has come to reflect the mounting standards of living of the population in these communities for whom the improvements are made. Advanced standards of school buildings and hospitals; improved sanitary provisions; better lighting systems; the widening and resurfacing of city streets; extensions of park systems, are all items in the expenditures of cities that increase with the rise of incomes of the urban population. While the figures do not lend themselves to this kind of analysis, it is probable that the expenditures for public construction by cities with a population of 30,000 and over now amount to more than one-fourth of the total expenditures for public works in the country; and this proportion would be even greater if expenditures for highways, financed largely by state, county and federal governments, were taken out of the totals.

Unfortunately, no statistical series are available to describe the changes in the expenditures of American municipalities for public works during the past century. The growth of the outstanding indebtedness of New York City since 1830 and the classification of this indebtedness by purpose throws considerable light on the matter. The variations are, in a measure, representative of the changes for the whole country, except, of course, that the expenditures of New York City for rapid transit came, in the latest decades, to consume a larger share of the total than is the case in smaller cities.
"In the outstanding indebtedness of 1860 the water supply was the principal item, with parks coming second. By 1897 docks and public buildings, streets and sewers, parks, schools and bridges all required substantial expenditures, but water still held the leading place. By 1926, parks, which had been second in importance in 1860 and third in 1897, held the eighth position. Rapid transit

expenditures topped all others, with water, schools, streets and sewers and docks following in the order mentioned. Such an order may be only temporary, but the differences in the amounts of indebtedness incurred for the different purposes are so great, and the city's borrowing-margin is so limited, that some time must elapse before these relative positions are materially modified." ${ }^{3}$

A view of the probable expenditures for public construction by cities is given in Table 2, which shows the combined contracts for public construction awarded in 14 selected cities for each year from 1919 to $1928 .{ }^{4}$ Contracts awarded are not a precise measure of the amount actually expended for construction during the period indicated, or of the volume of work under way or completed. There are indeed frequently great discrepancies between the volume of contracts awarded and the amount expended. ${ }^{5}$ In the absence of other measures, however, the figures furnished by the F. W. Dodge Corporation are a reliable representation of the volume, trend and distribution of expenditures for public construction.

Between 1919 and 1928 these 14 municipalities quadrupled their expenditures for public works. If New York City were omitted from the totals, the rate of increase for the remaining cities would be somewhat slower. In general, the large cities appear to have increased their public works expenditures much more rapidly than the smaller ones. Occasionally, also, the picture is distorted when a single city undertakes a new program of public improvements and contracts for construction are concentrated in a few years. Thus contracts awarded in St. Louis ${ }^{8}$ jumped from $\$ 1,700,000$ in 1919 to more than $\$ 18,000,000$ in 1928 , due, in the main, to large increases in the latter year in contracts for hospitals and institutions, bridges, lighting systems, and street paving and road construction.

Throughout the period since 1919, school buildings are the

[^1]CHART 3.-TOTAL PUBLIC CONSTRUCTION CONTRACTS AWARDED IN 17 SELECTED CITIES, 1919-1928

Source: F. W. Dodge Corporation, Statistical Division.
largest single item. Contracts for school buildings, hospitals and institutions, and public buildings of other character give a total for this group that accounts usually for more than one-third of the whole of public construction contracts. The next largest items are subways and tunnels, heavily weighted by the subway construction contracts of New York City, and sewage systems and streets and roads. Contracts for water supply construction run uniformly low throughout the period, except in the last year when New York City accounts for more than 90 per cent of the contracts awarded for this purpose. The construction of public parks involves expenditures in most years of this last decade of less than one per cent of the total.

The growth of city expenditures for public works is not an isolated phenomenon. It has its counterpart in the rising outlays since 1919 of all American units of government, and in the equally striking increase in the expenditures for private construction. To compare the rate of rise in public expenditures for construction with the rate of increase of other series that measure economic growth is not a simple task, because it is not clear what the arithmetical relation between these rates of growth should be. All that can be said is that increasing expenditures on public works have taken place in a period in which the income of the people of the United States has grown with great rapidity, when the capacity to pay taxes and to absorb bonds has been greater than before, and when the assessed valuation of property, even allowing for defects in the methods of measuring assessed valuation, has also mounted to new and higher levels.

The wide range of problems that surround the past and future construction programs of American municipalities are considered in detail elsewhere in this book. ${ }^{7}$ As with private construction, expanding programs of public improvement involve difficult problems of financing. Growing burdens of taxation and steady encroachment on more or less rigid debt limits frequently constitute the forces that slacken the rate of increase of public construction and keep it for a time on a low level. The vast number of public agencies concerned with administering these projects make unusually difficult the adoption of a procedure that might lead to greater uniformity and a larger measure of control. On the other hand, the
