turn out to be a cross-sectional view of a system still to experience major shifts. Or, with success in holding the main line, the relations now prevailing may persist with only minor modifications until the coming of peace releases strong new forces and drastically alters the conditions of economic equilibrium.

APPENDICES

The text of this monograph deals with selected aspects of the complex price movements of the last four years. For the benefit of those who may wish to study these movements in greater detail, or to trace changes not here discussed, various price and wage index numbers are brought together on a common base in Appendix Tables 1 to 8. Appendix Table 9 contains monthly index numbers of prices from 1927 to 1943 for the various groups entering into the commodity classifications of the National Bureau of Economic Research.

¹ The indexes of the American Appraisal Company are based on a detailed bill of quantities of material and labor required for typical frame, brick-wood frame, brick-steel frame and reinforced concrete buildings, with allowances for contractor's overhead and profit, in 30 representative cities throughout the United States.

² The indexes of the Aberthaw Construction Company, constructed quarterly are based upon the cost of constructing an 8-story reinforced concrete industrial structure by the company in Connecticut. The index does not include data for home-office overhead or for profit on the job, but is confined to the cost of labor, materials, plant, tools, insurance, etc., actually required for the construction of the building.

³ The measurements of the Associated General Contractors of America, Inc. combine indexes of wages and materials in the proportion of 40 per cent for the former and 60 per cent for the latter. Wages used in computing this index are for hod-carriers and common laborers; material prices are for sand, gravel, crushed stone, Portland cement, common brick, lumber, hollow tile and structural and reinforcing steel. Wages and prices are reported by 12 district offices of the Association.

⁴ The indexes of the *Engineering-News Record* include (1) the base price of structural steel shapes at Pittsburgh, wt. 24; (2) consumers' net price of cement exclusive of bags, f.o.b. Chicago, wt. 3; (3) lumber 2 x 4 S4S pine and fir (ENR 20 cities average), wt. 29; (4) common labor rate (ENR 20 cities, average of wage rates in force), wt. 44.

Computed by the U. S. Bureau of Labor Statistics from surveys of 90 individual industries based on samples from representative firms.

The percentage changes are accurate for the individual industries. It is to be noted, however, that they relate to changing numbers of workers, as between 1939 and 1943. In general, the greatest additions to the working force come in industries with high hourly rates of pay. This makes the average for all industries higher than it would be if constant weights were applied to the percentages for the several industries. The percentage for all manufacturing industries, averaged, represents the combined influence of changing weights and changing rates of pay. It measures the change (in average amounts received for an hour's work) between two periods differing substantially in the composition of the working population. It is not a simple index of wage rates.

APPENDIX TABLE 9

Wholesale Prices, Monthly Indexes, 1927-1943

Commodity Classifications of the National Bureau of Economic Research

1929=100

These index numbers are constructed by the National Bureau, using price quotations compiled by the U. S. Bureau of Labor Statistics. They were originally published in *Economic Tendencies in the United States* (1932) and, in greater detail, in *Prices in Recession and Recovery* (1936). The National Bureau takes this occasion to publish revised series of monthly measurements from November 1927 to June 1943. The differences between these indexes and the indexes appearing in *Prices in Recession and Recovery* are due to the substitution of a revised automobile index (1926-36) and a correction in the commodity crushed stone (1929-33). For an account of the methods employed in constructing these index numbers the reader is referred to *Prices in Recession and Recovery*, pp. 470-90. The user will realize that the great economic changes since December 1941 lessen the accuracy of measurements of price movements. Index numbers for products of the heavy industries and for other groups containing commodities markedly affected by the transition from peace to war are most seriously affected.

The price indexes of the National Bureau are here printed in full, as a permanent record. The National Bureau does not plan to extend these records beyond June 1943.

Each of the following combinations of groups represents a single principle of classification applied to all commodities:

Raw and processed goods

Producer and consumer goods

Durable goods, nondurable goods, and producers' fuels

All goods destined for human consumption, goods intended for use in capital equipment, building materials, and producers' fuels

Foods and nonfoods

Crops, animal products, mineral products, and forest products (thirty-six commodities that do not fit readily into these classes are omitted)

American farm products and products other than those originating on American farms.

The *numbers* (No.) of price series given at the heads of the various columns differ somewhat from those in *Prices in Recession and Recovery*. In the earlier publication price series included in more than one of the groups derived from a given principle of classification were counted more than once (e.g., automobiles were counted once in consumer goods, once in producer goods). The totals in the present tables do not include such duplications. When a commodity appears in more than one group the number is given a fractional value in each group; the fractions add to 1, in the total. These remarks do not apply to the commodity *weights* (Wt.). When a commodity is included in more than one group its weight is, of course, apportioned appropriately among the groups in question.
