

This PDF is a selection from an out-of-print volume from the National Bureau of Economic Research

Volume Title: National Income and Its Composition, 1919-1938,  
Volume II

Volume Author/Editor: Simon Kuznets, assisted by Lillian Epstein  
and Elizabeth Jenks

Volume Publisher: NBER

Volume URL: <http://www.nber.org/books/kuzn41-3>

Publication Date: 1946

Chapter Title: Supplementary Data

Chapter Author: Simon Kuznets, Lillian Epstein, Elizabeth Jenks

Chapter URL: <http://www.nber.org/chapters/c5561>

Chapter pages in book: (p. 849 - 914)

## PART FIVE

### Supplementary Data

PART FIVE assembles data supplementary to the basic estimates in Part Four. The series presented here were not included with the basic tables either because they are not available continuously or for all the relevant industrial divisions; or because they give information that does not relate directly either to income flow or to the number engaged. Yet it was thought that they would be of interest to readers who might wish to experiment with some breakdowns that could not be carried through continuously; to gauge the coverage of our samples; to observe the movements of some series on income flows, of which the basic estimates are derivatives at a remove (e.g., gross dividends and interest); to have at hand figures that would make possible variants of net savings of enterprises and of national income somewhat different from those in the basic tables.

No effort has been made to present all supplementary data. Only such series are given here as are readily accessible either in National Bureau files or in published sources; and even of these only those are presented that seem of most general interest as supplementary to the basic estimates in Part Four.

**T A B L E I****Compensation of Officers of Corporations**

Tables I 1-3 provide series on the compensation of corporate officers. The comprehensive series, i.e., for all corporations in the country, are not continuous; for this and other reasons it did not seem advisable to include them in the basic tables in Part Four. For the years and industrial divisions covered they may be compared, however, with total salaries or compensation of employees in Part Four; and used to apportion these totals between payments to subordinate employees and to administrative personnel.

TABLE I

Based on National Bureau grouping of Interstate Commerce Commission data.

\* The data for 1933-38 are not comparable with those for the earlier years, owing to a revision of the Interstate Commerce Commission occupational classification.

TABLE II

Sample Corporate Data Collected by the  
National Bureau

Table II describes the corporate samples compiled by the National Bureau for the years prior to 1930, for use mainly in estimating dividends for the early years in the period and long term debt and long term interest payments for all years prior to 1929. Since the National Bureau used the corporate sample collected by the Department of Commerce for years beginning with 1929, these tables cover the years through 1929 only.

For each industrial group in the sample the table shows in the second column the total (and the year) that is extrapolated or interpolated with the help of the sample. Comparison of this total with the entries in the following columns, which relate to the sample proper, indicate the extent of sample coverage relative to the comprehensive total.

TABLE II

Sample Corporate Data Collected by the National Bureau,<sup>1</sup> 1919-1930 (millions of dollars)

**Debt and Capital Stock are at par value as of December 31**  
**Debt and Interest are long term**

<sup>1</sup> The sources of other sample data collected by the National Bureau are given in the detailed notes in Part Four. Additional sample data have been supplied by the Bureau of Foreign and Domestic Commerce, National Income Division.

<sup>2</sup> Totals interpolated or extrapolated by the given sample.

<sup>3</sup> The 1917 sample figure is \$26.8 million.

<sup>4</sup> The 1917 sample figure is \$29.2 million.

<sup>5</sup> The 1917 sample figure is \$31.3 million.

<sup>6</sup> The 1917 sample figure is \$13.8 million.  
<sup>7</sup> The 1932 sample figure is \$17.9 million.

<sup>8</sup> The 1917 sample figure is \$33.6 million.  
<sup>9</sup> The 1917 sample figure is \$11.2 million.

<sup>10</sup> The 1932 sample figure is -\$8.8 million.  
<sup>11</sup> The 1918 sample figure is \$10.3 million.

<sup>12</sup> The 1918 sample figure is \$16.5 million.

## TABLE III

Gross Dividends and Long Term Interest Paid,  
Dividends and Long Term Interest Received,  
Total Interest Paid and Derived Short Term Inter-  
est Paid, All Corporations, by Industrial Divisions

Tables III 1-22 summarize the estimates of gross dividends and long term gross interest paid, as well as of dividends and long term interest received by corporations in various industrial divisions. These series of diminuends and subtrahends were the ones used to derive net dividends and net long term interest payments in the basic tables in Part Four.

For most industrial divisions we have in addition to gross long term interest paid a series on total interest paid (the latter usually reported in *Statistics of Income*). For these divisions we can derive estimates of short term interest paid by corporations. Such estimates are necessarily subject to wide margins of error but may be of value as rough approximations. They are not given for some public utilities for which gross long term interest paid and received is obtained from sources other than *Statistics of Income*.

Whenever two entries are given for 1934 the first is comparable with those for preceding years in that the *Statistics of Income* data used are based on the old industrial classification; the second is comparable with those for succeeding years in that the *Statistics of Income* data used are based on the new industrial classification.

## TABLE IV

### Gains and Losses from Sale of Capital Assets

Gains and losses from sale of capital assets are subtracted from the reported figures on net savings to yield an estimate of net savings (and of net product) consonant with the definitions developed in Volume I. The item is estimated by industrial divisions for years beginning with 1929, and may be of interest as suggesting the magnitude of this speculative element in the net income of enterprises.

For years prior to 1929 only a rough correction could be made. The corporate figures are averages of two estimates. The first is obtained by applying to estimated individuals' net gain on capital assets the geometric mean of the ratio of corporate to individual net gain in 1929 and 1935-37. Individuals' net capital gains are derived from *Statistics of Income* data for the successive years. The second is based on the net profit of real estate and holding corporations, reported in *Statistics of Income*, and the geometric mean of the ratio of corporate capital gains to it in 1929-34.

Entrepreneurial gains and losses from sale of capital assets are based on the corporate figures, the 1929 ratio of the former to the latter being extrapolated by the ratio of non-corporate to corporate depreciation. The depreciation figures are the accounting measures published in *Capital Consumption and Adjustment* (p. 262).

Since the income tax law for 1934 and later years limits the capital losses allowed to \$2,000 plus capital gains, the series is not strictly comparable for the entire period.

<sup>1</sup> Comparable with 1929-33 in that *Statistics of Income* data used are those based on the old industrial classification.  
<sup>2</sup> Comparable with 1935-38 in that *Statistics of Income* data used are those based on the new industrial classification.

## TABLES V AND VI

Both bad debts of corporations (or business enterprises at large) and taxes paid by them may in part be considered an element in their net savings transferred to individuals, and hence should be included in national income. For various reasons, discussed in Chapter 9, they have been excluded from our estimates of national income and net savings of enterprises. Such data relating to these two items as are readily accessible are summarized in Tables V and VI, for possible use as suggesting the magnitudes involved.

## TABLE VII

### Data Underlying the Adjustment of Business Savings for Effects of Inventory Revaluation, by Industrial Divisions

The adjustment of net profit and savings of enterprises for the effects of revaluation of inventories (see discussion in Ch. 8) involves a comparison of changes in inventories at constant valuation with changes in current valuation. The relevant series are derived from the National Bureau's study of Commodity Flow and Capital Formation. For various industrial divisions, they indicate the magnitude of the adjustment made for every industry in every year of the period.

By means of these series any student can remove the adjustment and recalculate both net savings of enterprises and net income originating to a basis that includes the effects of changing inventory valuation.

## TABLE VIII

Data Underlying the Adjustment for the Difference  
between Depreciation and Depletion Charges at  
Cost and at Current Reproduction Prices

The adjustment of net savings of enterprises for the difference between depreciation and depletion at cost and current reproduction prices (see Ch. 8) is derived from data in *Capital Consumption and Adjustment* (Tables 29 and 31). The difference between the accounting and economic measures, shown there, is corrected for depreciation on farmers' property since our agricultural net savings are taken after deducting depreciation on a current price basis. The distribution of the total corrected depreciation adjustment between incorporated and unincorporated firms is based on Mr. Fabricant's estimates of corporate and non-corporate (excluding farmers') depreciation and depletion charges (see *Capital Consumption and Adjustment*, p. 262).
