NBER Working Paper No. 24733
June 2018, Revised October 2018
JEL No. D71,D72,H2

ABSTRACT

We design and conduct large-scale surveys and experiments in six countries to investigate how natives perceive immigrants and how perceptions influence their preferences for redistribution. We find strikingly large biases in natives' perceptions of the number and characteristics of immigrants: in all countries, respondents greatly overestimate the total number of immigrants, think immigrants are culturally and religiously more distant from them, and are economically weaker — less educated, more unemployed, poorer, and more reliant on government transfers — than is the case. While all respondents have misperceptions, those with the largest ones are systematically the right-wing, the non college-educated, and the low-educated working in immigration-intensive sectors. Support for redistribution is strongly correlated with the perceived composition of immigrants — their origin and economic contribution — rather than with the perceived share of immigrants per se. Given the very negative baseline views that respondents have of immigrants, simply making them think about immigration in a randomized manner makes them support less redistribution, including actual donations to charities. We also experimentally show respondents information about the true i) number, ii) origin, and iii) “hard work” of immigrants in their country. On its own, information on the “hard work” of immigrants generates more support for redistribution. However, if people are also prompted to think in detail about immigrants' characteristics, then none of these favorable information treatments manages to counteract their negative priors that generate lower support for redistribution.

1 Introduction

The current vitriolic debate about immigration may appear light-years away from the poem

*“Give me your tired, your poor,
Your huddled masses yearning to breathe free”*

on the Statue of Liberty. *The Economist* recently called immigration “perhaps the defining issue of the 2016 election” in the U.S.,¹ and it has also been an incandescent campaign topic in many recent elections in Europe. At the same time, despite a sharp increase in inequality, sustaining a generous level of redistribution in light of stagnating growth and aging populations is becoming increasingly difficult. The conflicts about scarce resources become even more intense when they are intertwined with national, ethnic, and religious fragmentation.

We examine native citizens’ perceptions of and attitudes towards immigration, and how these relate to support for redistribution. In what ways do people (mis)perceive the number and the characteristics of immigrants? Does a surge in real or perceived immigration flows reduce support for the welfare state? Are people worried about the number of immigrants or rather about their composition – in terms of origin, religion, or economic circumstances? We uncover large misperceptions about the quantity, origin, and characteristics of immigrants and these misperceptions are related to lower support for redistribution among natives.

We design and run large-scale international surveys on a representative sample of around 22,500 respondents from six countries (France, Germany, Italy, Sweden, the U.K., and the U.S.).² These countries are very different economically and socially, but, in many ways, have had the immigration issue at the center of their political arenas. We elicit the respondents’ perceptions of immigrants, such as the number, origin, or economic circumstances of the latter; we then explore natives’ attitudes towards immigrants, and their views on immigration and redistribution policies. To investigate the causal link between immigration perceptions and redistribution, we also randomly treat respondents with three “information treatments,” which provide different sets of information about the true share, the origin, and the work ethic of immigrants.

In the survey, we define an “immigrant” as somebody legally living in the country of the respondent, but born abroad; we repeat this definition very clearly several times in the survey.³ The surveys – which are restricted to natives – begin with detailed background information questions about respondents’ income, sector of work, family status, zip code, whether he has immigrant parents, political orientation, and voting. We then ask respondents about their perceptions of immigrants along many dimensions, which is one of our key contributions. Some perceptions can be verified using actual statistics and data: the number, the origin, the education, the employment, the poverty of immigrants, and the transfers they receive. Others are personal attitudes about how hard immigrants work or whether they free-ride on the system. We then ask respondents about their views on their country’s immigration policies.⁴ The perception of immigration and attitudes towards immigration questions are referred to as the “immigration block.”

The next set of questions ask about respondents’ views on policies, with a focus on redistributive policies, such as how to allocate the government’s budget or how much of the total tax burden people with different

¹*The Economist*, “The state of the opposition: Democrats have plenty of anger, but few good ideas.” 05/17/2018.

²The surveys are run through commercial survey companies between November 2017 and February 2018.

³This is the definition officially used by the OECD (OECD, 2015). See Section 2 for a detailed explanation.

⁴These include: how much immigration there should be, whether the government should care equally about immigrants and natives, when immigrants should be eligible for benefits, when they should be able to get citizenship and vote, and when they would be considered to be truly part of the country.

incomes should bear. To get at the question of private (non-government based) redistribution, as well as to test for a real effect of the treatments, we also tell respondents that they are enrolled in a lottery to win \$1000, but that before knowing whether they have won, they have to commit a share (zero or positive) of their gain to one or two charities that help low-income people. This set of questions is called the “redistribution block.”

Natives have overall striking misperceptions about the number and composition of immigrants. In all the countries, the average and median respondents vastly overestimate the number of immigrants. For instance, in the U.S., the actual number of legal immigrants as defined above is 10%, but the average perception is 36%; In Italy, the true share of immigrants is 10%, but the perceived share is 26%. Respondents also systematically misperceive the composition of immigrants. They believe immigrants are more likely to come from more culturally distant regions (which are often branded as “problematic” in the public debate) and that they are economically much weaker and less able to contribute to their host country than is the case. For instance, respondents starkly overestimate the share of Muslim immigrants, immigrants from the Middle East and North Africa, and strongly underestimate the share of Christian immigrants. They believe that immigrants are less educated, poorer, more likely to be unemployed, and more likely to receive government transfers than they are in reality.

What is perhaps most striking is that the sign and magnitudes of these stark misperceptions hold across all groups of respondents, whether we split them by income, age, gender, education, political affiliation, or sector of work. While there is substantial heterogeneity and while some respondent groups are more accurate than others, they are still substantially wrong. Respondents who have the largest misperceptions along most dimensions we ask about are those with low levels of education who work in sectors more exposed to immigrants, the non college-educated, women, and right-wing respondents. While left and right-wing respondents misperceive the share of immigrants to the same extent, they have very different views about the composition of immigrants; right-wing respondents in all countries systematically consider immigrants to have “less desirable” in their views characteristics. Respondents who live in a commuting zone in the U.S. with a high share of immigrants have larger misperceptions.⁵ As we discuss in the paper, while misperceptions of other economic forces have been documented before, it is the consistency, sign, and magnitude of the misperceptions that make immigration perceptions peculiar and noteworthy.

The perceived share of immigrants alone is not a key driver of the support for either immigration or redistribution policies, but the perceived characteristics of immigrants are. Controlling for the full array of individual respondent characteristics including political affiliation, we see that support for immigration and redistribution are strongly positively predicted by the perceived work ethic of immigrants, and the share of immigrants that are highly educated, as well as by knowing an immigrant personally. They are significantly negatively predicted by the perceived share of immigrants who are free-riding, low educated, unemployed, or Muslim.

We then turn to our experimental part and our informational treatments. We begin with our “order of the questions” treatment, whereby half of the respondents are randomly shown the immigration block before the redistribution block and vice versa. This allows us to study the effects of purely making respondents *think* about immigration and the characteristics of immigrants on their answers to redistribution policy related questions. We find significantly negative effects of simply prompting respondents to think about immigrants and their composition: respondents who are asked first about their perceptions of immigration (without

⁵We also find that personally knowing an immigrant is correlated with more accurate perceptions of immigrations, although the link is not causal.

receiving any information on immigrants) and only then about redistributive policies show a significantly larger aversion to redistribution – including actual donations to charity – than those who are asked about redistribution first and immigration second. The real effect of donating less to charities not related to immigration – just from being primed to think about immigrants – is particularly novel and noteworthy. This is to be interpreted in light of our aforementioned findings of very negative views that respondents hold about immigrants, their difference to them, and their economic contributions to their host country. Consistent with this, it is those respondents with the worst baseline priors about immigrants who react most negatively to being prompted to think about immigrants.

Respondents are also randomized into one of three informational treatment groups. The first informational treatment informs respondent about the true number of immigrants in their country; the second treatment informs them about which regions immigrants in their country come from; the third one shows them an anecdotal day in the life of a low-income, very hard-working immigrant.⁶ Our three informational treatments have strong first-stage effects: treated respondents’ perceptions on the number, origin, or hard work of immigrants are significantly different from those of the control group in the way that was expected. We also conducted a follow-up survey in the U.S. to show that the effects on perceptions of the informational treatments persist after one to three weeks.

The “hard working immigrant” treatment on its own has strong effects on support for redistribution: treated subjects become significantly more favorable to redistribution when reminded that at least some immigrants are hard-working. However, when respondents are shown the immigration block first, and are thus asked to go through detailed questions about the number and characteristics of immigrants, their negative priors dominate; none of the favorable informational treatments is able to overcome the negative effects on redistribution of prompting people to think at length about immigrants’ characteristics.

Since all groups of respondents have negative and biased baseline views of immigrants, all of them react negatively to being made to think about immigrants. Groups which have more negative baseline views (the non college-educated, especially if they also work in immigration intensive sectors, the right-wing) react more strongly to the order treatment and are less inclined to change their views after viewing the favorable “hard work treatment.”

Our results imply that people’s attitudes on immigration and redistribution are formed in an environment of misinformation – perhaps even disinformation. Rather than being corrected as we attempt to do here, these misperceptions may be strategically manipulated or even fostered by parties or interest groups averse to immigration or redistribution.

Our paper is related to the abundant literature on the relationship between general cultural and social fragmentation (not just immigration) and the welfare state. Many papers, mostly in economics, are reviewed in [Alesina and Giuliano \(2011\)](#) as well as in [Stichnoth and Van der Straeten \(2013\)](#). A common result is that generosity (both public and private) travels less well across racial, ethnic, religious, and nationality groups than it does within such groups.

[Luttmer \(2001\)](#) shows that racial group loyalty means that individuals show stronger support for welfare spending if their own racial group is more strongly represented among its recipients. Similar findings appear in [Lee and Roemer \(2006\)](#), [Roemer, Lee, and Van der Straeten \(2007\)](#), and [Gilens \(1995\)](#). [Luttmer and Singhal \(2011\)](#) show that immigrants bring with them and preserve the preferences for redistribution that apply in their country of origin.

⁶In addition, our main surveys and experiments are complemented by a series of smaller pilots, in which we tested some other interesting randomizations, which we report in the text, such as randomizing the name given to immigrants in the examples.

On the theory side, in recent work, [Bisin and Verdier \(2017\)](#) provide a model of public good provision as a function of the fragmentation versus integration of minorities. [Hansen \(2003\)](#) develops a model where the median voter is affected by the welfare burden of transfers to immigrants and has cultural preferences. [Spolaore and Wacziarg \(2017\)](#) also develop a theory of cultural heterogeneity and inter-group conflict. [Bordalo, Coffman, Gennaioli, and Shleifer \(2016\)](#) provide a model of “stereotypes,” building on [Gennaioli and Shleifer \(2010\)](#), which could explain several of our findings.

Other empirical papers about views of immigrants mostly use pre-existing surveys, which have far less detailed variables on immigration than our survey has and lack an experimental (causal) component ([Senik, Stichnoth, and Van der Straeten, 2009](#); [Alesina, Murard, and Rapaport, 2018](#)). [Mayda \(2006\)](#) studies the characteristics of people which are against immigration in the 1995 waves of the International Social Survey Programme (ISSP) and the World Value Survey (WVS). Our newly designed cross-country surveys allow us to consider a much broader and comprehensive set of perceptions about immigrants in a standardized and quantitative manner.

The two papers closest to ours are, first, the excellent recent work by [Barrera Rodriguez, Guriev, Henry, and Zhuravskaya \(2018\)](#) for France. The authors randomly allocate voters into a control group and three treatment groups: the first receives “alternative” facts on immigration from the far-right presidential candidate’s campaign (Marine Le Pen or MLP); the second receives true facts on the same issues; the third group receives the alternative facts, followed by fact-checking. The first main finding is that voters do update their knowledge based on true facts and fact-checking. This is consistent with our first-stage findings that respondents accurately update their views based on the true statistics shown to them. The second main finding is that exposing respondents to MLP’s messages increases support for her, with or without fact-checking, consistent with the idea that increasing the salience of an issue such as immigration will favor the candidate who puts the issue at the forefront of their campaign. This is again very much in line with the findings from our “Order treatment” whereby just making respondents think about the issue of immigration (without providing any information) reduces support for redistribution. The second paper is the important recent work by [Grigorieff, Roth, and Ubfal \(2018\)](#), who consider how giving correct information about immigrants in a survey in the U.S. shapes support for immigration. Their focus and scope are thus quite different from our focus on the accuracy of perceptions and on the links with redistributive and other policies (not only immigration policies). In a nutshell, the differences between these two related papers and ours are that our analysis is done in several countries, centers around telling respondents only true facts in the treatments and focuses on eliciting detailed perceptions on an array of (as it turns out, very important) characteristics of immigrants as well as on many policies in order to draw an accurate map of what shapes the link between these perceptions and policy preferences. We list our contributions relative to these other papers in the last paragraph of this section in more detail.

Natural experiments such as waves of migration have been exploited in several papers. [Facchini, Margalit, and Nakata \(2016\)](#) study the effects on support for immigration of an informational campaign in Japan about the economic contribution of immigrants in that country. [Dahlberg, Edmark, and Lundqvist \(2012\)](#) identify a negative impact of refugees – a very specific type of immigrants – on reduced redistribution support in Swedish localities. [Chevalier et al. \(2017\)](#) look at the inflow of poor immigrants with voting rights in West Germany post WWII and their effects on redistribution. [Tabellini \(2018\)](#) shows that there has been political backlash against immigrants, even if the latter economically benefit the host community, by exploiting exogenous variation in European immigration to U.S. cities in the first half of the 20th century. [Card, Dustmann, and](#)

Preston (2012) show that compositional concerns about local amenities and public goods is important in explaining support for immigration. In an important recent paper, Damm, Dustmann, and Vasiljeva (2016) estimate the causal impact of refugee migration on electoral outcomes in Denmark, exploiting a policy that assigned refugees quasi-randomly to different municipalities.

Methodologically, we are contributing to a growing literature that runs surveys and implements online information experiments. The most recent and closest work is by Kuziemko et al. (2015), Kuziemko et al. (2014), Charité, Fisman, and Kuziemko (2015), Karadja, Mollerstrom, and Seim (2017), Cruces, Perez-Truglia, and Tetaz (2013), Alesina, Stantcheva, and Teso (2018), Weinzierl (2017), and Fisman, Kuziemko, and Vannutelli (2017).

Finally, our estimates help assess the factors that people use when determining the “generalized social welfare weights” they place on others, as proposed by Saez and Stantcheva (2016) in the public economics literature on social preferences. Various principles for preferences for redistribution have recently been explored by Lockwood and Weinzierl (2015), Lockwood and Weinzierl (2016), Weinzierl (2014a), and Weinzierl (2014b), which our analysis can help inform.

In sociology and political science, the question of immigration has also been studied conceptually and empirically. In political science, a long-standing debate focuses on whether anti-immigration sentiments arise purely from economic considerations or rather from worries about cultural dilution and there is support for both views (Hainmueller and Hopkins, 2010; Hanson et al., 2007; Hainmueller and Hopkins, 2015; Bansak et al., 2016). These papers focus on openness to *immigration*, not redistribution policies. In sociology, Emmenegger and Klemmensen (2013) argue that the link between preferences for redistribution and attitudes towards immigration may theoretically not be simple, depending on whether a voter is reciprocal, self-interested, egalitarian, or humanist. Reeskens and Van Oorschot (2012) discuss the “New Liberal Dilemma” namely the difficulty of generating widespread support for welfare programs, which were put in place in times of cultural homogeneity.

Contribution: A condensed summary of our contributions is as follows: First, we provide new, detailed, and standardized cross-country surveys that combine questions on perceptions of and attitudes towards immigration, and a range of different policies. Second we investigate much more detailed and quantitative perceptions, about not only the number of immigrants, but also their origins, religion, education, work effort, unemployment, and transfer receipts. This is crucial because, contrary to findings from less detailed questionnaires, it is not the number of immigrants *per se* that drives support for immigration or redistribution, but rather their perceived composition (characteristics). Importantly, we check these perceptions against reality. Third, we not only focus on the relation between perceptions and immigration policies, but also between perceptions and an array of redistribution and general policies. Fourth, our order treatment and three informational experiments allow us to establish causality in these relations; the order treatment is a subtle new way to test for the effects of simply talking about immigration in the public debate.

The rest of the paper is organized as follows. Our data collection, survey construction, and experimental design are explained in detail in Section 2. The full survey text is in the Appendix. Section 3 describes the perceptions about immigrants, across countries and respondent characteristics. Section 4 investigates the correlation between perceptions of immigration and preferences for redistribution. The findings from the experimental part of our study and the informational treatments are discussed in Section 5. The last section concludes.

2 The Survey, the Experiments, and Data Sources on Immigration

2.1 Data Collection and Sample

We conducted large-scale surveys in six countries: Germany, France, Italy, Sweden, the U.K., and the U.S. The sample sizes are 4500 for the U.S., 4001 for the U.K., 4001 for Germany, 4000 for France, 4000 for Italy, and 2004 for Sweden, for a total of 22506 respondents. The surveys were conducted between November 2017 and February 2018. In the U.S., a follow-up survey was implemented for each respondent, one week after he took the initial one. This allows us to test for the persistence of the treatment effects. Only natives (non-immigrants) between 18 and 70 years of age were allowed to take the survey.

We design the surveys using an online platform; the survey links are then diffused by commercial survey companies in each country. For the U.S., the respondents were reached through C&T Marketing (<http://www.ctmarketinggroup.com>). The European countries were centrally managed by *Respondi* (<https://www.respondi.com/EN/>). These companies are in touch with panels of respondents to whom they send out survey links per email. Respondents who click on the link are first channelled through some screening questions that ensure that the final sample is nationally representative along gender, age, and income dimensions. Respondents are paid only if they fully complete the survey. The pay per survey completed was around \$3. The average time for completion of the survey was 27 minutes and the median time was 21 minutes.⁷

The final sample is close to representative in each country. Table 1 shows the characteristics of our sample relative to the population in each country. Population statistics come from the Census Bureau and the Current Population Survey for the U.S. and from Eurostat and various national statistical offices for European Countries, as described in the table notes. By construction, we are almost perfectly representative along the dimensions of age, gender, income (binned into four brackets, to mimic the way the quotas are imposed during the survey). In addition, our sample is also representative on non-targeted dimensions such as the share of respondents who are married. Our sample is slightly less likely to be employed (either part-time or full-time), but not more likely to be unemployed (except to a small extent in the U.S.). In some countries, such as the U.S., France, and Italy, respondents in our sample are more likely to be college-educated than the general population. To address these two small imbalances, in Appendix A-11, we re-weight the sample so that it is representative along the employment and education dimensions as well. Our results are robust to this re-weighting.

2.2 The Survey Structure

The full survey in English is available in Appendix A-6. The questionnaires in German, Italian, French, and Swedish can be seen by following the links in the Appendix, which lead to the web interface of the survey. We enrolled the help of several native speakers for each language to ensure that the translation was suited to the local culture and understanding.⁸ Below, text in *italic* represents actual survey text. Italic text in square brackets represents the answer options provided to the respondents, if any. We provide the text as it is in the U.S. survey and refer to the host country as the U.S.

We give the following definition of an immigrant:

⁷The full distribution of survey durations is provided in Figure A-4.

⁸The three authors are fluent in four of the five languages.

“In what follows, we refer to immigrants as people who were not born in the U.S. and legally moved here at a certain point of their life. We are NOT considering illegal immigrants.”

In general, there could be two definitions of *legal* immigrants: i) by citizenship, (i.e., all people legally living in the country who do not have citizenship), and ii) by country of birth (i.e., all people who legally live in the country but were born in another country). Our definition is the second one, which is also the one most frequently used by the OECD (OECD, 2015) because it is more comparable across countries, i.e., is not affected by countries’ citizenship policies, which are very heterogeneous.

We focus on legal immigrants for two reasons. First, illegal immigration may pose very different challenges and thus generate different reactions among respondents than legal immigration. Second, it seems conceptually useful to separate the issue of support for immigration (how many immigrants respondents think there should be and how receptive their home country should be to them) from the issue of enforcement of immigration laws. We thus decided to keep this clear distinction and to not mix the issues of immigration and illegal entry. This distinction is most relevant in the U.S., where close to 3.5% of the population are illegal immigrants; in the European countries, the share of illegal immigrants is very small and does not make any substantive difference to any of the statistics about immigration that we compute. For the U.S., we explain below how we construct all statistics for legal immigrants.⁹

The survey is structured as follows:

1) *Background socio-economic questions about the respondent:*

Employment status, family situation, highest education level achieved, household income, political orientation, sector of employment, immigrant parents, zip code, etc.

2) *Information Treatments:*

We show one of three information treatments to randomly chosen subsamples. Before proceeding, we provide the above definition of an immigrant. The first treatment provides the correct information about the number of immigrants in the respondent’s country; the second provides the correct information about the country of origin of the immigrants in the respondent’s country; the third shows an example of a “day in the life” of a hard-working immigrant.

We then have two blocs of questions, the order of which is randomized, in addition to the randomization of the information treatments.

3) *Immigration Block:*

The first block includes questions about the perception of immigrants, namely, their number, origin, religion, economic circumstances, transfers received, and work ethic. It also contains questions about support for various immigration policies, such as how much immigration there should be, when immigrants should get citizenship, or when they should be eligible for benefits.

4) *Redistribution Block:*

The other set of questions is about redistributive policies, including the progressivity of the tax system, and the allocation of government spending. We also investigate the willingness of respondents to donate to charities and ask about attitudes towards government.

We now provide more details on each of these survey blocks.

⁹For completeness, we compute the full set of statistics for total and illegal immigrants as well in the Appendix.

Background socio-economic questions

We collect information on respondents' gender, age, income, highest level of education achieved, sector of occupation, employment status, marital status, number of children, place of residence, and political orientation. The latter is investigated in two ways. First, we ask respondents to classify themselves in terms of their views on economic policy, along a spectrum ranging from "very conservative" to "very liberal."¹⁰ Second, we ask them for which party or candidate they voted or would have voted (in case they did not vote) in the last presidential (or chancellor) election.¹¹ If an election is impending (as was the case for Italy and Sweden), we also ask which party or candidate they planned to vote for.

We also ask the respondent whether one or both of his parents were immigrants (i.e., not born in their current country of residence). We collect information on the respondent's sector of employment (and, if he is currently unemployed, on the sector in which he last worked). We are thus able to classify respondents into "high immigration sectors," which we define as sectors in which the share of immigrants is above the national average. The full sector classification is summarized in Appendix A-3.¹²

The information treatments

The randomly chosen treated respondents see one of three information videos, which are available on YouTube.¹³ We provide some screenshots below to give an idea of the design of each treatment.

The first treatment informs respondents about the actual share of immigrants in their country, and compares this to the shares of the OECD countries with similar income levels and with the lowest share of immigrants (Finland, with 6.1%) and the highest share (Switzerland, with 29.1%). This second piece of information is destined to give respondents an accurate view of how their own country ranks among other developed economies in terms of immigration. We refer to this treatment as the "Share of immigrants" treatment (see Figure 1).

Because the issue of illegal immigration is so salient in the U.S., we run two versions of this treatment for the U.S.: one shows respondents the share of total immigrants (13.5%) and one shows them the share of legal immigrants (10%); in the text displayed in each version, it is made clear whether the number relates to total or legal immigrants. There are several considerations to weigh here: showing respondents in the U.S. only legal immigrants may still leave them with very large overestimates of the share of illegals; making respondents focus on the gap between legal and illegals would make the treatment quite different for the U.S. than for the other countries (where this gap is close to negligible). We thus decided that it is most rigorous to run the two versions of this treatment on different samples of respondents and report both sets of results.

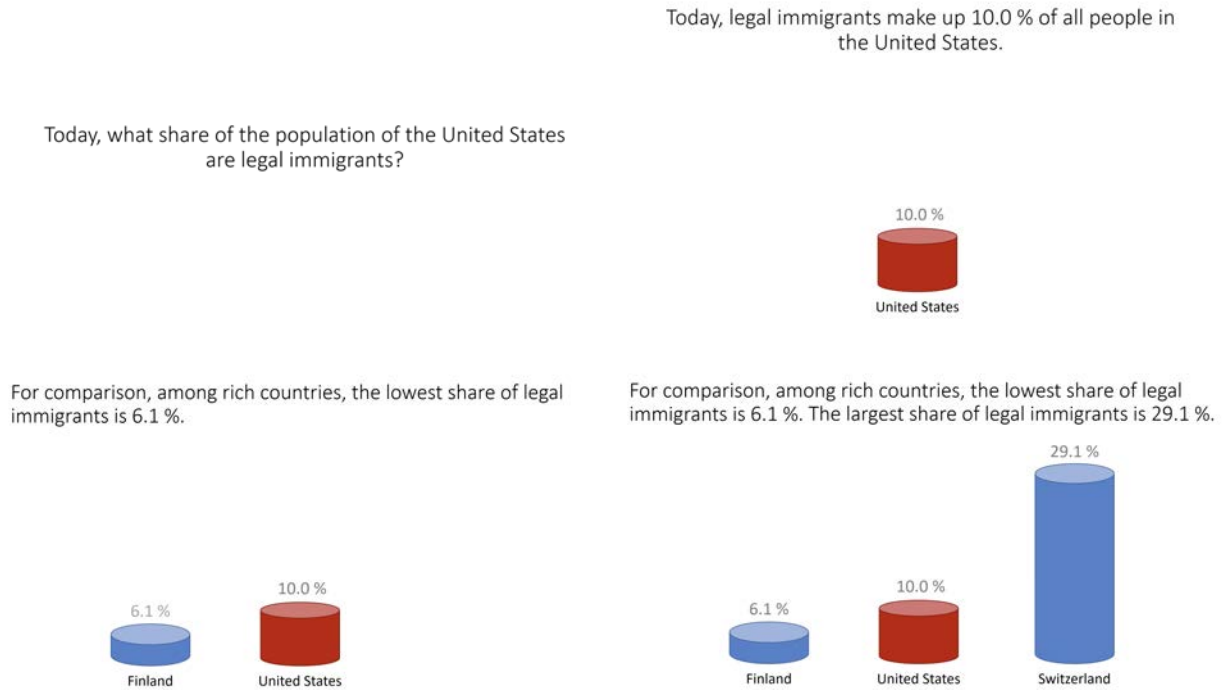

¹⁰ "On economic policy matters, where do you see yourself on the liberal/conservative spectrum?" With options [*Very liberal, Liberal, Center, Conservative, Very Conservative*] in the U.S. and the U.K., and [*Far left, Left, Center, Right, Far right*] in the other countries.

¹¹ More precisely, we first ask respondents whether they voted in the last elections or not. If they did, we ask them to select the candidate or party they voted for; if they did not, we ask them to select the candidate or party they would have most likely supported if they had voted. In some countries, the electoral system is such that people vote for parties. In others, they vote for candidates. In the U.S. and in France we provide a list of all the presidential candidates. In the other countries we list all the major parties that together attract more than 95% of the vote and also add an empty field for "Other" where respondents can write the party that they voted for. Afterwards we classify candidates and parties into *Far left, Left, Center, Right* and *Far right*.

¹² For instance, in the U.S., immigration intensive sectors are: Farming, fishing, and forestry; Building and grounds cleaning and maintenance; Construction and extraction; Computer and mathematical occupations; Production occupations; Life, physical, and social science; Food preparation and serving related occupations; Occupations related to transportation and material moving; Occupations related to personal care, childcare and leisure; Healthcare support occupations.

FIGURE 1: TREATMENT “SHARE OF IMMIGANTS”

As we will show, none of these versions manages to increase support for redistribution, which, it turns out, is not driven by the perceived share of immigrants per se, but rather by their perceived characteristics.¹⁴

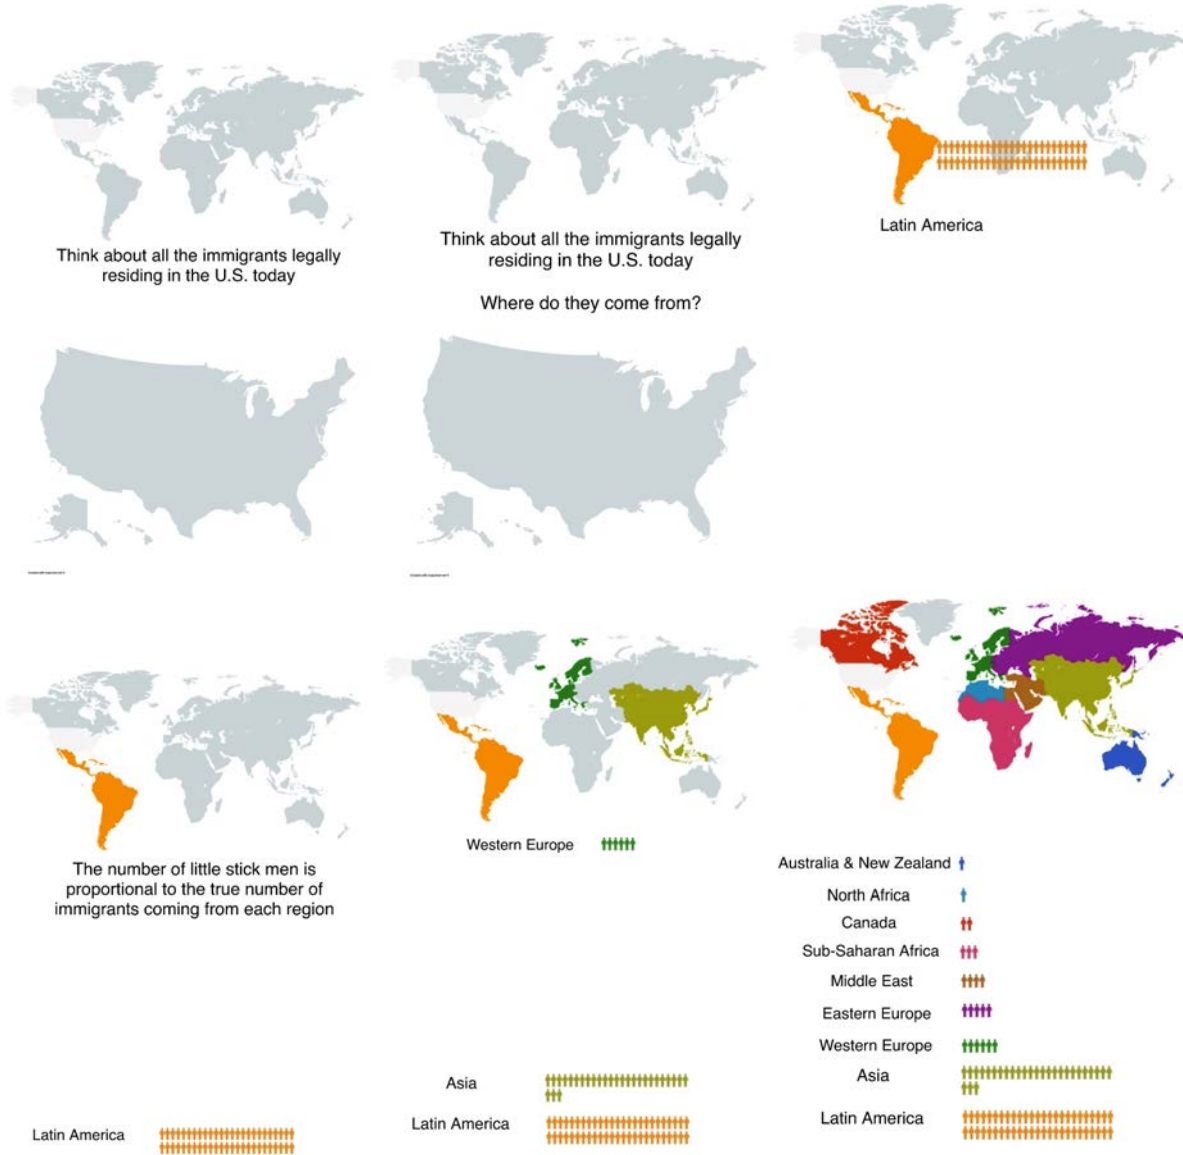

The second treatment informs respondents about the origins of the immigrants in their country. All the countries in the world are grouped into nine broad areas (North America, Latin America, Eastern Europe, Western Europe, Sub-Saharan Africa, the Middle East, North Africa, Australia and New Zealand, and Asia). Respondents are shown a map, with each region sequentially appearing in a different color (so that there is no doubt about which region any given country is part of) and a number of “stick men” proportional to the number of immigrants from that region appearing and moving to the bottom of the screen, where they remain until the end of the video. This is referred to as the “Origin of immigrants treatment.” It is illustrated in Figure 2.

The third treatment shows a “day in the life” of a very hard-working immigrant woman, based on true cases.¹⁵ She works long hours, puts in a lot of effort to also study at night in order to improve her modest living conditions and that of her children, and hopes to start her own small business in the future. The video (see the screenshots in Figure 3) walks respondents through the hours of the day, as indicated by a clock at the top of the screen.

¹⁴Because the other two treatments are designed in a more qualitative way, they would not change noticeably if we also ran a version for total immigrants for each of them (rather than for legal only).

¹⁵There are many articles in the media providing examples of very hard-working immigrants. We have combined several sources and changed the names. Two examples are: *The Washington post* “They said I was going to work like a donkey. I was grateful” July 11, 2017 available at <https://www.washingtonpost.com/news/wonk/wp/2017/07/11/they-said-i-was-going-to-work-like-a-donkey-i-was-grateful> and *Forbes* “6 Immigrant Stories That Will Make You Believe In The American Dream Again” Oct 4, 2016 available at <https://www.forbes.com/sites/monteburke/2016/10/04/6-immigrant-stories-that-will-make-you-believe-in-the-american-dream-again>.

FIGURE 2: TREATMENT “ORIGIN OF IMMIGRANTS”

Immigration block

This block begins with the key questions about perceptions of immigrants. First, the respondent is asked about what share of the population are immigrants using a slider and a pie chart as illustrated in Figure 4. When the respondent lands on this page, the pie chart appears fully grey and the slider is at zero. If anything, this initialization should bias respondents towards providing a small number, the exact opposite of our findings. As respondents move the slider, the pie chart interactively appears in two colors, one representing the share of U.S. born people, the other the share of foreign born ones. The slider and pie chart design serves two purposes: first, it is much less tempting to enter round numbers: indeed, as the histograms in Figure A-5 show, there are relatively few round numbers reported. Second, the interactive and colored

FIGURE 3: TREATMENT “HARD WORK OF IMMIGRANTS”

Emma legally came to the U.S. at age 25.

She lives with her husband - a construction worker - and two small children in a one-bedroom apartment.

She starts work at 5 am every day of the week, earning the minimum wage for such tasks as restocking the shelves, helping customers, mopping the floor and cleaning the bathrooms.

When her day shift at the store ends at 3 pm, Emma starts her second job as a cleaning lady.

For the past 5 years, she has been working in a retail store.

She takes two buses to get to her clients.

She finishes around 7 pm and gets home by 8 pm.

She then makes dinner for her family and sometimes helps the children with their homework before they go to bed.

Emma takes online courses. She stays up until midnight to work on her courses.

She cannot take out a loan to go to a full-time college.

Emma and her husband have no free time, no weekends, and haven't taken any holidays since arriving in the U.S..

Despite working two jobs and barely making ends meet, Emma is very happy to be in the U.S..

She hopes that thanks to her hard work she will one day be able to start her own small business.

display that reacts in real-time to a respondent's movements captures his attention.

We then ask respondents what share of the total immigrants in their country come from each of the nine regions of origin (described above in the context of treatment “Origin of immigrants.”) Again, we use a slider plus pie chart display shown in Figure 5. There is one slider per region of origin and the pie chart adapts in real-time with different colors for each region. A sticky map at the top shows the boundaries of each region, with matching colors.

The next question asks about the share of immigrants from each of the most common religions. We then turn to questions about the economic conditions of immigrants, namely, their unemployment levels, their likelihood of having a College education or of not having completed high school, the share living below the poverty line in the country, and the average transfer they get relative to the average native. We always ask first about natives and then about immigrants, in order to have a comparison point.

To give an example, the question about poverty reads:

“Out of every 100 people born in the U.S., how many live below the poverty line? The poverty line is the estimated minimum level of income needed to secure the necessities of life.”

“Let's compare this to poverty among legal immigrants. Out of every 100 legal immigrants in the U.S. today, how many do you think live below the poverty line?”

The questions about unemployment and education are analogous. We also ask about the transfers received

FIGURE 4: ELICITING PERCEPTIONS ON THE SHARE OF IMMIGRANTS

The pie chart below represents all the people currently living in the U.S. Out of all these people currently living in the U.S., how many do you think are legal immigrants? Move the slider to indicate how many out of every 100 people you think are legal immigrants.

by immigrants. The question for the U.S. reads as follows (and is adapted to each country to reflect the transfer programs in place there):

“U.S. -born residents receive government transfers in the form of public assistance, Medicaid, child credits, unemployment benefits, free school lunches, food stamps or housing subsidies when needed. How much do you think each legal immigrant receives on average from such government transfers? An average immigrant receives:” [No transfers; ... ; More than ten times as much as a US born resident].

We then ask about perceptions of the work effort of immigrants:

“Which has more to do with why an immigrant living in the U.S. is poor?” [Lack of effort on his or her own part; Circumstances beyond his or her control.]

“Which has more to do with why an immigrant living in the U.S. is rich?” [Because she or he worked harder than others; Because she or he had more advantages than others.]

Our next question describes two people, John and Mohammad, who are identical along all dimensions, except that Mohammad is a legal immigrant. The exact names used are adapted to each country to feature one native-sounding and one Muslim-sounding name. Respondents are asked whether Mohammad pays more or less taxes than John and whether he receives more or less transfers. This complements the question above on unconditional transfers, by holding everything relevant fixed – thus, if respondents respond anything other than “the same” they are expressing some bias in favor or against the immigrant.

The next set of questions asks about views on immigration policy and cover four areas: 1) the number of immigrants the respondent believes should be allowed to enter the country and whether or not the

FIGURE 5: ELICITING PERCEPTIONS ON THE ORIGIN OF IMMIGRANTS

current number is problematic; 2) when immigrants should be eligible for transfers such as welfare; 3) when immigrants should be allowed to apply for citizenship and vote in U.S. elections; 4) when the respondent would consider an immigrant to be “truly’ American.”

At the very end of the block, we also asked whether a respondent has a close acquaintance or friend who is an immigrant.

Redistribution block

This block of questions is about general redistribution towards low income individuals. It never makes any reference to immigrants. The questions also refer to the “government” in general, not specifically to the incumbent government. For the U.S. and Germany (the two federal countries in our sample), we explicitly state that we refer to total spending and taxes at the “federal, state, and local levels.”

It is important in our view to separate respondents’ views on 1) the total size of the government (how much involvement and spending is optimal), 2) how to raise the funds needed for government policies and 3) how to spend a given level of funds. Our questions are designed to address each of these three aspects in isolation, holding the two other aspects fixed. We first explain to respondents that we will ask them separately about how to raise a given tax burden (aspect 2) and then how to allocate it to the different major spending categories (aspect 3): *“For the purpose of these questions, suppose that the level of government spending is fixed at its current level and cannot be changed.”* We also ask about support for various policies targeted to the poor (public housing assistance, support for schools for low-income children, and income support programs). Here, we allow the respondent to express a wish to either increase or decrease the total size of government (aspect 1), but we still emphasize that this may come at a cost: *“Keep in mind that, in order to finance an expansion of any of these, other types of spending (like spending on infrastructure and defense, for example) would have to be scaled down or taxes would have to be raised.”*

Taxes: To provide more details about aspect 2), respondents are asked to select average income tax rates for four income groups using sliders: the top 1%, the next 9%, the next 40% and the bottom 50%. The taxes they select are constrained to raise the current level of revenue in their country. This is illustrated in Figure A-2.¹⁶

Spending: On aspect 3), we ask respondents to allocate 100% of the budget to seven spending categories: 1) Defense and National Security, 2) Public Infrastructure, 3) Spending on Schooling and Higher Education, 4) Social Security, Medicare, Disability Insurance, and Supplementary Security Income, 5) Social Insurance and Income Support Programs, 6) Public Spending on Health, and 7) Affordable Housing (see Appendix Figure A-3). Some of these spending categories are redistributive (in particular, 3), 4), 5), 6), and 7)) while others are not (i.e., 1) and 2)).

Views of government: We also ask respondents four questions about their views on the role and scope of government.¹⁷ These include whether *“income differences between rich and poor people”* are a problem or not; whether to *“reduce income differences between rich and poor people the government (at the local, state, or federal level) has the ability and the tools to do”* something or not; whether they generally trust the government to do what is right; and to rate how strongly the government should *“concern itself with income inequality”* on a scale of 1 (*“Not at all”*) to 7 (*“Everything in its power to reduce income inequality”*).

Donation to charity: To end the redistribution block (and to check whether respondents put their money where their mouth is), we tell respondents that they have been automatically enrolled in a lottery to win

¹⁶We already used an identically designed tax question and budget allocation question (described below) in Alesina, Stantcheva, and Teso (2018). While respondents select tax rates on each of the four groups, a fifth slider at the bottom moves and depicts the fraction of the revenue target that has been raised. When the revenue target has been met, the slider turns green and a message alerts the respondent.

¹⁷In Alesina, Stantcheva, and Teso (2018), we found that the level of trust in government was quite low especially in France and Italy and this may lead to negative views about government intervention in general.

\$1000. Before they know whether they have won or not, they need to commit to donating none of it, part of it, or all of it to one or two charities. We selected two charities in each country to be 1) targeted towards low income adults or children in general and not concerned with immigrants particularly; 2) popular and well-perceived in each country. They are listed in Appendix A-4. For instance, for the U.S. we chose “Feeding America” and “The Salvation Army.”¹⁸

Layers of Randomization

The order in which the “redistribution block” and “immigration block” are shown to respondents is randomized. Therefore, there are two randomizations in place, which create eight treatment or control groups, summarized in Table A-1 in the Appendix: 1) the three information treatments (“Share of immigrants”, “Origin of immigrants” and “Hard work of immigrants”); 2) the order of the redistribution and immigration blocks. Table 2 shows that each randomization is balanced along observable characteristics.

Based on these many and detailed survey questions, we define several variables and indices used in our analysis. We define them as we go and refer to them throughout the text and in the tables and figures. The reader can refer to their detailed definitions collected in Appendix A-1.

2.3 Data on Immigration Across Countries

Many of our perception questions can be checked against actual data. We construct the empirical counterparts of all the variables for which we elicit perceptions using U.S. and European data. Appendix Section A-2 lists all the data sources and details all the steps in the construction of these statistics (all the raw data and all our calculations are available in the excel spreadsheet at https://www.dropbox.com/s/136otyc13tnkdsd/Database_US.xlsx?dl=0). For the U.S., we construct all the statistics for legal immigrants, as well as for illegal and total immigrants. The former two are not as readily available and, because there is some uncertainty surrounding the characteristics of illegal immigrants, we provide bounds for each statistic, using several different data sources. These calculations may prove useful for future researchers as well. In the paper, all statistics regarding U.S. and European immigrants refer to legal immigrants only.

2.4 Ensuring High Quality Answers

We implemented several methods to ensure the highest possible quality of answers. In the survey’s landing page – the consent page, depicted in Appendix Figure A-1 – we warn respondents that *“responding without adequate effort may result in [their] responses being flagged for low quality* and that their pay for the survey may be withheld. We also attempt to make them feel involved and socially responsible by emphasizing that we are non-partisan researchers seeking to advance social studies. We highlight that it is *“very important for the success of our research that you answer honestly and read the questions very carefully before answering.”*

Questions are designed so as to prevent careless answers: for instance, percentages are constrained to add up to 100% and respondents cannot move to the next page before this is the case. Rather than using data entry boxes, we let the respondents move sliders, the values of which are shown in real-time on the pie charts. This fulfills two goals: first, respondents face an interactive screen, which captures their attention,

¹⁸We also tried to pick charities without a religious connotation whenever possible.

and, second, there is much less risk of selecting round numbers. Questions are initialized in a neutral way, with sliders at zero and the pie charts fully grey (i.e., not showing any of the answer categories).

We also keep track of and check the time spent by the respondent on the survey as a whole, as well as on individual pages. Thus, we can flag respondents who spend too little time on either the full survey or on one of the questions about immigrant perceptions. For instance, only 1% of our respondents completed the survey in less than 6 minutes or spent less than 11 seconds on the question about immigrants origins. We also have the number of clicks on each page. For the benchmark sample, we drop respondents in the top 2% and bottom 2% of the survey time distribution. We checked that none of our results are affected by trimming these outliers.¹⁹

Just before the questions on immigrant perceptions, we strategically place an attention check question. We ask respondents whether they have paid careful attention to the preceding questions and whether they honestly believe that we should count their responses in our analysis. Almost all respondents (99.5%) answer that yes. This type of questions is used to prompt the respondents to pay attention to the subsequent questions of the survey. Its purpose is fulfilled regardless of whether the respondents answer honestly (Meade and Craig, 2012).

Finally, we ask respondents whether they thought that our survey was biased towards either left-wing or right-wing opinions. Only 16.8% of respondents say they felt some bias, out of which 10.6% thought it was left-wing biased and 6.2% thought it was right-wing biased. Dropping respondents who felt the survey is biased actually strengthens our treatment effects somewhat.

3 Perceptions of Immigration

We now describe all the perceptions about immigrants, focusing on some key results. For a more comprehensive overview, Table A-2 reports average perceived values and actual values for each country and for all perception-related variables, as well as the corresponding medians and interquartile ranges. Table A-3 provides the same information, but by respondent groups.²⁰ All these descriptive statistics are based on the control group, namely the respondents who did not see any of the informational treatments.

3.1 Perceptions: Share, Origins, Economic Circumstances

The Share of Immigrants

Panel A of Figure 6 shows the average perception of respondents in each country about the share of immigrants (red squares), as well as the actual share (blue diamonds). The shaded areas represent the 95% confidence intervals around the average perceptions.

The discrepancy between perceptions and reality is striking. With the exception of Sweden, the average respondent in all countries thinks the share of immigrants is at least twice as high as it is in reality. In the U.S., respondents believe that there are on average 36.1% immigrants, when the actual share of immigrants is 10%. In Italy, the share of immigrants is 10%, but respondents believe it is 26.4%. Swedish respondents are the most accurate, but still substantially inaccurate: the actual number of immigrants is 17.6%, but the

¹⁹These results are available on demand. The distribution of survey durations is depicted in Figure A-4.

²⁰Appendix A-11 re-weights the sample to make it fully representative also along the non-targeted dimensions of employment and education.

average perception is 27%.²¹ The median respondent perceives a lower share than the average respondent, indicating some right-skewness in the distribution of perceptions. However, even the median respondent starkly overestimates the share of immigrants. In fact, it is only the 25th percentile respondent’s perception that is somewhat closer to reality.

To further see the dispersion in responses, Figure A-5 shows the distribution of misperceptions of the share of immigrants. Misperceptions are defined as the perceived value minus the actual value. There is a share of respondents who believe the share of immigrants is very high. However, even if we exclude respondents whose misperception is in the top 20%, we still get very substantial misperceptions, as was already clear by looking at the median respondent: the average perceived share of immigrants excluding the top 20% is 27% in the U.S., 23% in the U.K., 22% in France, 19% in Italy, 22% in Germany, and 20% in Sweden. We also get very substantial misperceptions even if we exclude respondents who spent too little time on the this question.²²

Panel B of Figure 6 shows the average misperceptions of respondents grouped according to several personal characteristics (all countries pooled), listed on the y axis. The shaded areas represent the 95% confidence intervals around the average perceptions.

The groups are: those who work in high immigration sectors and have a college degree; those who work in high immigration sectors, but have no college degree; the college-educated; the non college-educated; high-income respondents; low-income respondents; those who have an immigrant parent; those who do not have an immigrant parent; the young; the older ones; male vs. female; and left-wing vs. right-wing. While most of these characteristics are self-explanatory, we provide more detail on two of them. First, as explained above, we classify respondents into high immigration sectors based on whether their current sector of employment (or their last sector, if they are currently unemployed), has an immigrant share higher than the national average. Within low and high immigration sectors, we distinguish between respondents with college education and those without. Left wing and right-wing respondents are classified based on their voting in the last election. Our classification of all parties into left, right and center is shown in Appendix A-1.; “center” respondents are not shown in the graphs. The results are robust to classifying respondents based on their views on economic policy issues (ranging from very conservative to very liberal).

There are three key findings. First, respondents in all groups think there are substantially more immigrants than there actually are – in no group is the average misperception lower than 15 percentage points. Second, some groups of respondents have substantially higher misperceptions than others. These are respondents who are low educated in high immigration sectors, the non college-educated, those with an immigrant parent, the young, and women. Third, there is no difference in the average perception of the share of immigrants for left and right-wing respondents.

Why are misperceptions so large? One possibility is that respondents mistakenly include in their estimates illegal immigrants. Nevertheless, it is hard to imagine this being the main reason for the large misperception, unless respondents are inflating the number of illegal immigrants to improbably large proportions: In the U.S., the actual share of illegal immigrants is 3.5% and in the European countries, it is generally less than 0.5% of the population. It could also be that people confuse immigrants with minorities which have been in the country for several (sometimes many) generations. This may signal genuine lack of knowledge, or, alternatively an attitude that all minorities are “foreigners” (despite having been in the country for many

²¹Sweden is the country with the highest share of immigrants.

²²The average perceived share of immigrants excluding those who spent less than 12 seconds on this question is 35% in the U.S., 30% in the U.K., 28% in France, 24% in Italy, 30% in Germany, and 26% in Sweden.

generations).²³ On all misperceptions documented in this paper, including the number of immigrants, it may be that the media coverage and the general political rhetoric makes the issue of immigration (and especially its more problematic aspects) highly salient.

Origin and Religion of Immigrants

Respondents misperceive not only the total share of immigrants in their country, but also their origins and religion, as shown in Figure 7.²⁴ Respondents in all countries think that immigrants come disproportionately from non-occidental countries – often branded as “problematic” in the recent public debate – such as the Middle East, Sub-Saharan Africa, or North Africa. They underestimate the share of occidental immigrants. There are some variations across countries: U.S. respondents very sharply overestimate North African and Middle Eastern immigrants, as do Italian, U.K., and Swedish respondents (the latter do so to a lesser extent). France overestimates Middle Eastern immigrants by a factor of two, but slightly underestimates North African immigrants (of which there are substantially more than in all other countries in our sample). In Germany, respondents overestimate the share of North African immigrants by a factor of eight, but are exceptionally accurate on the share of Middle Eastern immigrants, perhaps because they are very aware that the large Turkish minority, to which they are accustomed, are not immigrants.

In all countries except France, respondents also very significantly overestimate the share of Muslim immigrants. The largest misperceptions along this dimension are in the U.S. – where respondents believe that the share of immigrants who are Muslim is 23%, while the reality is closer to 10% – and in Sweden — where the perceived share of muslims is 45%, while the reality is 27%. The U.K., Italy, and Germany overestimate the share of Muslim immigrants by between 10 and 14 percentage points. In all countries, without exception, respondents strongly underestimate the share of Christian immigrants (the religion of the majority of people living in our sample countries), by at least 20 percentage points and often by much more. In the U.S. respondents believe 40% of immigrants are Christian, when the true number is 50% higher (at 61%); in the U.K. the perception is 30%, while there are in reality again almost twice as many at 58%. The same holds for all other countries.

These misperceptions are systematic: there is no group of respondents that does not overestimate the share of Muslim immigrants and underestimate the share of Christian immigrants. Those who have the largest misperceptions are the non college-educated, especially if they also work in an immigration-intensive sector, and the older, the female, and the right-wing respondents. In this case, the gap between left and right-wing respondents is very large and significant.

Economic Circumstances of Immigrants

Figure 8 shows that in every country except Sweden the respondents believe that immigrants are much poorer than they actually are, especially in France and the U.S. In addition, in all countries, respondents overestimate the share of immigrants that is unemployed by an enormous amount: In Germany, the gap is 30 percentage points; in Italy it is 27 percentage points; in the U.S. it is around 20 percentage points. One conjecture is that respondents do not properly understand the distinction between unemployed and out of the labor force, although we do state it clearly.²⁵ However, in the data, respondents do not overestimate the unemployment

²³We provide suggestive evidence for this in Section 3.3.

²⁴Recall that the complete set of perceptions about the fraction of immigrations that come from each possible origin region and their religion are shown in detail in Table A-2 (by country) and Table A-3 (by respondent characteristics).

²⁵“By unemployed we mean people who are currently not working, but searching for a job (and maybe unable to find one)”

rate amongst natives to the same extent; perceptions and, most crucially, the *misperceptions* on immigrants' unemployment are systematically and significantly *larger* than for natives' unemployment by around 10 percentage points. In addition, while left and right-wing respondents overestimate the unemployment rates of natives by the same amount, right-wing respondents overestimate the unemployment rate of immigrants significantly more. We return to this point below.

In all countries with the exception of Italy, respondents think that there are more immigrants who have not completed high school than is the case, as shown in Figure 9. Respondents also think that fewer immigrants have college education than is true. However, the misperception gaps about education at the country level are not large. Nevertheless, there are clear heterogeneities by respondent characteristics, and some respondents have large misperceptions along the education dimension as well, namely, the non college-educated, those working in high immigration sectors who do not have a college degree, right-wing respondents, older respondents, and female respondents. Here again, it is not a matter of respondents simply underestimating the share of highly educated people overall; in fact, they systematically *overestimate* the share of highly educated natives by around 10 to 15 percentage points, and systematically underestimate the share of highly educated immigrants.

An important consideration respondents may have is whether those who benefit from redistribution are immigrants. Figure 10 addresses this question in two ways. First, the top left panel of Figure 10 plots the perceived share of immigrants among poor people in the country; the top right panel plots the perceived share of immigrants among the low-educated in the country.²⁶ The perceived representation of immigrants among these economically fragile groups is starkly inflated relative to reality. Thus, respondents may be overestimating the extent to which redistribution and their own taxpayer dollars go towards helping immigrants rather than natives.

Second, and more directly, the bottom panel of Figure 10 shows the perceived transfers to an average immigrant relative to the transfers to an average native, as well as the actual relative transfers, including or excluding pensions. Since immigrants in these six countries are on average younger than the general population, the relative transfers to immigrants including pensions are much lower than those excluding pensions. In most countries, the average perceived relative benefit is close to the true one excluding pensions, but significantly above the true one including pensions – three times as high in Italy, twice as high in France. Perhaps even more revealing, in all countries, a significant proportion of respondents (around 20% in the U.S., Italy, and Sweden, close to 25% in France) believe that immigrants receive more than twice as many benefits as natives (see Figure A-6); this view is especially common among right wing respondents. Once again, those who think immigrants benefit more from government transfers are very consistently the non college-educated, women, lower income respondents, and right-wing respondents.

A question the reader may have is whether people are in general confused about many economic statistics and phenomena. However, there are several reasons why the misperceptions of immigrants are peculiar. First, the misperceptions are systematically wrong in the same direction for almost all respondents (e.g., as explained above, even the 25th percentile respondent overestimates the share of immigrants), all subgroups of respondents, and in all countries. For other types of perceptions explored in past work, larger samples exhibit the “wisdom of crowds” effect as showcased in DellaVigna and Pope (2016), whereby the average perception is relatively accurate, even if individual perceptions are inaccurate. Alesina, Stantcheva, and

²⁶We do not ask respondents about these numbers directly (see the Questionnaire in A-6), but infer them based on their perceived share of poor (respectively, low educated) immigrants and natives, as well as their perceived share of immigrants.

Teso (2018) also find that the wisdom of crowds holds when asking people about intergenerational mobility, except for some specific variables and groups (e.g., U.S. respondents are the only ones to starkly overestimate mobility to the top). Second, for the variables for which we can compare the perceptions about natives to those about immigrants, we see that the bias is smaller for natives and sometimes even in the opposite (more favorable) direction.

3.2 Attitudes Towards the Effort and Contribution of Immigrants

Panel A of Figure 11 plots the share of respondents who say that immigrants are poor because of a lack of effort rather than due to circumstances beyond their control in each country (the red squares). This is compared to the share of respondents who say this about the general, non-immigrant population taken from our earlier work (Alesina, Stantcheva, and Teso, 2018) (the blue diamonds). In France and Italy people have a more negative attitude towards poor immigrants than they do towards poor people in general. In the U.K. and Sweden, there is no difference in views about immigrants and natives. In the U.S., views are slightly more positive towards immigrants. Even for natives, U.S. respondents put much more weight on individual responsibility in shaping outcomes and, perhaps because of that, assess better the hurdles stacked against immigrants when they have to make it out of poverty. We did not have data for Germany in our earlier survey.²⁷

Right-wing respondents are much more likely to believe that immigrants are poor because of lack of effort. These patterns fit well with earlier findings (see our literature review above) that U.S. respondents are much more likely to associate poverty with lack of effort than do European respondents (especially those from France and Italy) and that right-wing respondents are more inclined to blame poor people for their own fate. Despite these variations in views on the merits of poor immigrants, views on the merits of rich immigrants are strikingly consistent across countries.

Panel B of Figure 11 show the perceptions related to immigrants and natives for being rich because of one’s own effort (as opposed to exogenous advantages) by country and by core respondent characteristic. In all countries, respondents agree that, if an immigrant is rich, it must be mostly because of their own effort. Respondents also agree that this is more true for immigrants than it is for natives. In Italy, the gap is particularly large: while Italians believe that only 17% of the rich people are rich because of their own effort, they think that 70% of rich immigrants are rich due to their own merit. The U.K. and France have less extreme, but still similar patterns. This may reflect the beliefs of Italians especially, but also French and English respondents, that the system is penetrated by family connections and social advantages, which maintain rich dynasties at the top even though they are not the ones who worked hardest. Consequently, because immigrants by construction lack these inherited advantages and sticky social classes, the (possibly very few) rich immigrants must have put in a lot of effort to become rich.

Figure 12 plots the share of respondents, by country and by core characteristics who say that “Mohammad” gets more transfers or pays more taxes than “John.” This is to check whether there is implicit bias, i.e., whether respondents believe that Mohammad gets more than John not because he is poorer, but because he is an immigrant (John and Mohammad are described to be exactly the same except for the fact that one of them is an immigrant). In all countries except Sweden, a substantial share of respondents say this

²⁷To give a sense of attitudes in Germany for comparison, the Appendix Section A-10 describes German respondents’ answers to a question from the German General Social Survey (ALLBUS/GGSS, 2014), inquiring about the importance of several factors, including luck and hard work, for one’s success.

is the case, especially in France, Italy, and the U.S.. The right panel shows that, again, it is low-educated respondents in high immigration sectors, those without college education, those who do not have immigrant parents, the old, and especially right-wing respondents that are significantly more likely to say Mohammad gets more on net from the government.²⁸

3.3 Geographic Patterns and Local Influences

Figure 13 shows immigration perceptions across U.S. states. Panel A represents the actual shares of legal immigrants in each state; Panel B shows the average perception of the national share of legal immigrants across respondents in each state.²⁹ As the colors move from darker green to darker red, the share of immigrants (actual or perceived) becomes higher. The misperceptions are very large in all states, as can be seen by the complete lack of overlap of colors between the two panels. Some states with relatively more immigrants, such as California, Texas, or Florida, appear to have larger absolute misperceptions about the share of immigrants. But there are other Midwestern and Southern states which also have high misperceptions, despite the fact that their share of immigrants is very low relative to the national average.³⁰

A state-level analysis may obscure heterogeneity at finer geographical levels. Thus, we turn to the commuting zone level.³¹ Figure 14 shows the coefficients β from a regression at the respondent level

$$\text{Perceived share of Immigrants}_i = \alpha + \beta \mathbb{A}_i + \gamma \mathbb{X} + \varepsilon_i$$

where the left-hand side is the respondent’s perceived share of immigrants, \mathbb{A}_i is the full set of variables listed vertically (each of them standardized into a z-score and all included at the same time in the regression), and \mathbb{X} is, as before, the full set of respondent characteristics, including also dummies for whether the respondent is Hispanic or African-American. Respondents who live in CZs with a larger share of immigrants perceive a larger (and, hence, less accurate) share of immigrants. The same goes for respondents who live in areas with high crime rates. Conditional on the share of immigrants, a recent inflow of immigrants into the CZ (since 2010) is not significantly associated with the perceived share of immigrants. On the other hand, respondents who perceive a lower (and, hence, more accurate) share of immigrants tend to live in areas with larger shares of Hispanics or African-Americans (even controlling for their own ethnicity). This could indicate that they are much more aware about the distinction between immigrants and minorities, and are used to diversity and to seeing Americans of different ethnicities. Consistent with this hypothesis, respondents from CZs with higher racial segregation tend to perceive a higher share of immigrants (but these effects are just marginally insignificant at the 10% level). Living in an area with a higher share of college-educated people is also correlated with a lower perceived share of immigrants (even conditional on a respondent’s own education).

In Appendix A-9 we also show that knowing an immigrant is correlated with significantly more accurate views and more favorable attitudes towards immigrants.

²⁸In a smaller pilot, we randomized the name of the immigrant that was given in this question between a name that sounded i) North American (“Jack”) in the U.S. and Western European for the European countries; ii) Hispanic in the U.S. and France (“Miguel” and “José”) and Eastern European in Europe; iii) Muslim (“Mohammad” or “Ibrahim”). The exact names used were as follows. UK: William, Andrei, Mohammad; France: Paul, José, Mohammad; Italy: Francesco, Andrei, Mohammad; Germany: Michael, Vladimir, Ibrahim. The name itself didn’t make a large difference, but the sample size was small.

²⁹Recall that the actual average is 10% for legal immigrants.

³⁰The overall correlation between perceptions and reality is -0.05, but is not significant.

³¹This analysis is currently done for the U.S. only at the commuting zone (CZ) level due to lack of data for European countries.

4 Immigration Perceptions and Support for Redistribution

We now turn to the relation between perceptions of immigration and support for redistribution. We start with some key descriptive facts about support for redistribution and immigration across countries and respondents (for the control group only). For completeness, all the tabulations of all variables related to support for immigration and redistribution are in Appendix Tables A-4 and A-5.

4.1 Support for Immigration and Redistribution Policies

Figure 15 tabulates the attitudes towards immigration by country (Panel A) and by core characteristics (Panel B). Each plot shows the share of respondents by country or group who answer yes to the following questions (from bottom to top): i) Immigration is not a problem; ii) Immigrants should be eligible for benefits at most three years after arrival; iii) Immigrants should be allowed to apply for citizenship at most five years after arrival; iv) The respondent would consider an immigrant to be truly “American” as soon as they get citizenship; v) The government should care equally about everyone living in the country whether native or not.

There are varied patterns of attitudes towards immigration in different countries, highlighting the need to ask several questions about different aspects, as we do. In the U.S., people believe strongly that immigrants should be considered “truly American” as soon as they become citizens, and that they should get citizenship relatively soon. They are also most likely to say immigration is not a problem and relatively likely to say that the government should care equally about everyone in the country. However, and consistent with their generally lower support for benefits, they are the least likely to say that immigrants should be eligible for benefits soon. In contrast, in European countries, most starkly in France, Italy, Germany, and, to a lesser extent in the U.K., respondents are less likely to say the government should care equally about everyone, that immigrants should be allowed to apply for citizenship soon, or that they will be considered as truly part of the country upon citizenship. Very few respondents (around a fifth) say that immigration is not a problem in their country. Overall, the U.S. is the country that is most supportive of immigration and France, Italy, and Germany are the least supportive ones.

Turning to the attitudes towards immigration by respondent characteristics, we see that for all variables, the most favorable attitude for any respondent group is always that of left wing respondents, and the least favorable view is that of right-wing respondents. In between, the non college-educated are consistently less supportive than the college-educated, across all dimensions. Those without college in immigration-intensive sectors are more averse to immigration than either people in high immigration sectors in general, or the non college-educated in general. On the other hand, those with college in high immigration sectors are weakly more supportive than those with college. This large heterogeneity even within immigration intensive sectors is clear in the public debate too; recall in the U.S. the outcry in Silicon Valley (a perfect example of a high skill, immigrant intensive area) during the Trump travel bans.

4.2 Perceptions, Redistribution and Immigration policies

To summarize views of immigration and redistribution, we construct two standardized indices, called the “Immigration Support Index,” and the “Redistribution Support Index” following the methodology in Kling *et al.* (2007). Each index consists of an equally weighted average of the z-scores of the policy outcomes

variables related to support for immigration (respectively, support for redistribution) with signs oriented so that more support for those policies means a higher corresponding index.³²

The immigration support index components are variables i) through v) from Figure 15, which we just described.³³ For the redistribution support index, they are a set of dummies each equal to one if i) the respondent supports more spending on education, ii) public housing, iii) income support programs for low income people, and iv) if they believe that inequality is a big problem, v) a variable ranging from 1 to 7 where 1 means that the respondent thinks that the government should not care at all about income inequality and 7 means they think that the government should do everything in its power to reduce inequality, vi) their preferred tax rate on the top 1%, vii) minus their preferred tax rate on the bottom 50%, viii) the share of the budget they would like to allocate to health, ix), education, x) safety net policies, xi) pensions, and xii) affordable housing.

Figure 16 highlights two key patterns related to support for immigration and redistribution. The top panel plots the redistribution index against the immigration support index by bins, controlling for many individual characteristics and country fixed effects. Support for redistribution and immigration are closely correlated. The bottom panel plots the redistribution index against the perceived representation of immigrants among the poor. This graph shows more directly that, conditional on a set of individual-level controls, respondents who believe that immigrants are more represented among the beneficiaries of redistribution, and, thus, more likely to receive transfers, also support less redistribution.

Panel A of Figure 17 plots the vector of coefficients β from the regression:

$$\text{Immigration Support Index}_i = \alpha + \beta \mathbb{A}_i + \text{country fixed effects} + \varepsilon_i$$

where the left-hand side is the respondent's Immigration Support index and \mathbb{A}_i is the full set of variables listed vertically (each of them standardized into a z-score), which includes perceptions of immigrants, as well as personal characteristics. The perceived share of immigrants has no effect at all on support for immigration. On the contrary, the perceived share of Muslim immigrants, of North African and Middle Eastern immigrants, the perceived share of unemployed immigrants and immigrants with low education is negatively correlated with support for immigration. Those respondents who believe that immigrants are poor because of lack of effort, that immigrants who are rich have no merit, that there are few highly educated immigrants, that immigrants get more transfers than natives, and that "Mohammad" gets more transfers on net support much less immigration. Thus, even conditional on political affiliation, which is itself very highly correlated with support for immigration, a favorable attitude towards immigration is very strongly correlated with a respondents' beliefs about the economic contribution of immigrants to the host country and their hard work.³⁴

Panel B of Figure 17 repeats this analysis, but the dependent variable is now support for redistribution, and the set \mathbb{A} is expanded to also include views on immigration policy. Consistent with the findings on support for immigration, the perceived share of immigrants per se does not negatively impact support for

³²Recall that the full set of variables used in the construction of these indices is tabulated across countries and respondent characteristics in Table A-4 and in columns (1) to (12) of Table A-5.

³³Variable v) enters the index in levels from 1 to 7, as it is asked in the survey, where 1 means the respondent thinks that the government should only care about natives and 7 means he thinks that the government should care equally about everyone living in the country.

³⁴Alesina and Angeletos (2005) provide a model in which the perception of effort put in by the beneficiaries of redistribution is a crucial determinant of citizens' views about the welfare state. This consideration thus applies to perceived effort by immigrants as well.

redistribution (if anything, the correlation is mildly positive after including this detailed set of controls). Again, respondents' beliefs on whether immigrants can contribute economically to the host country are strongly correlated with views on redistribution, especially beliefs on the hard work of immigrants and, importantly, the share of poor who are immigrants, as discussed above. A lot of the effects are absorbed by the proximate variables entering the immigration support index. These proximate variables summarize a respondent's overall attitude towards immigrants, itself shaped by their underlying perceptions about the characteristics of immigrants: respondents who support more redistribution are those who think that immigration is not a problem, that the government should care about everyone equally, that immigrants should be entitled to benefits and allowed to apply for citizenship soon after arrival. Finally, despite controlling for both proximate and more fundamental perceptions, the left-wing dummy is still very strongly correlated with support for redistribution.

5 Experimental Evidence on Immigration and Redistribution

So far, we have focused on correlations between support for redistribution and immigration, conditional on personal respondent characteristics. We now turn to the experimental evidence to provide a causal link.

5.1 The Order of Questions Treatment

Our first experimental treatment is simply to randomize the order in which respondents see the “Redistribution block” and the “Immigration block.” The effects of this treatment are shown in the first line of Table 3. Those who were shown the immigration questions first are more averse to redistribution, believe inequality is less of a serious problem, and donate less to charity. The magnitudes are economically significant; being prompted to think about immigrants reduces the redistribution index by 0.02; this effect is equivalent to 7% of the gap in the redistribution index between left and right wing respondents.³⁵ The share of respondents who say inequality is a serious problem declines by 3 percentage points, which represents around 5% of the control group mean and 13% of the gap between left and right-wing respondents.³⁶ Thus, when natives are prompted to think about immigration, all the negative views on immigration which we documented in Section 3 resurface and, as we showed in Section 4, these negative views are correlated with lower support for redistribution. The other lines of the table focuses on the effects of the three informational treatments, to which we now turn.

5.2 First Stage Effects of the Informational Treatments

We randomly show respondents one of the three informational treatments described in Section 2. The control group sees no such information. The first-stage effects on the key perceptions of immigration of these treatments are shown in Table 4 and work very well. Each treatment significantly affects perceptions along the dimension it was designed to do and generally does not shift perceptions along the other dimensions. To avoid any variable selection, in Appendix Table A-7, we show the treatment first-stage effects on the full range of perception variables.

³⁵The average redistribution index is 0.126 for left-wing respondents and -0.15 for right-wing respondents.

³⁶The answers to all questions about redistribution and all components of the redistribution index are tabulated by country and respondent characteristics in Table A-5.

The treatment “Share of immigrants” significantly reduces respondents’ misperception of the share of immigrants by 5 percentage points (column 1). Given how far perceptions were from reality to start with, this represents a bit less than one third of the average misperception in the control group. Some respondents may not have believed the info provided, especially if it clashes with their prior, or they may not have paid sufficient attention to the exact number. Appendix Figure A-5 shows the full histograms of responses in the control and treatment groups for each country. The “Share of immigrants” treatment significantly compresses all responses in the treatment group towards zero or low misperceptions. Some respondents – especially those with extreme initial responses – maintain their extreme opinions. Column 2 shows the effects of the treatment on a dummy equal to 1 if the respondent’s misperception is zero. While only 4% of respondents are correct in the control group, this share increases to 27% among respondents treated with information on the number of immigrants. In fact, the share of respondents who are accurate within 2 percentage points is 34% in the treatment group, as opposed to 10% in the control group; the share of those who are accurate within 5 percentage points is 49% in the treatment group and 25% in the control group. This treatment does not significantly affect the perceived origin of immigrants, nor their perceived work ethic, which is as intended. For the U.S., the results for the “legal only” version of the treatment “Share of Immigrants” in Table A-6 are much stronger: the misperception on the share of immigrants is reduced by 13 percentage points, and the share of respondents who are exactly correct is 42% in the treated group, as opposed to just 6% in the control group (recall our discussion of the rationales for having these two treatment versions for the U.S. in Section 2). Yet, as we will see below, neither version of this treatment for the U.S. manages to improve support for redistribution.

The treatment “Origin of immigrants” on the other hand significantly reduces the misperception on the origins of immigrants. It decreases the misperception of the share of immigrants from the Middle East and North Africa by 38% relative to the control group (column 3), as well as Muslim immigrants overall by 16% (column 5). It decreases also the misperceptions (equivalent to increasing the perceived shares) of immigrants from North America, Eastern and Western Europe by 32% (column 4) and Christian immigrants by 10% (column 6). It does not shift the perceived work effort of immigrants (column 7). It does, however, increase the perceived share of immigrants overall. This may be due to the fact that the animation makes respondents think about all the regions that immigrants may come from and this not only makes the topic more salient, but also can lead them to perceive that there are more immigrants.

The third treatment, “Hard work of immigrants,” is designed to influence the perception of the work effort of immigrants. Indeed, treated respondents are 5 percentage points less likely to say that lack of effort is the reason why poor immigrants are poor, which represents a 14% reduction relative to the control group. There is no effect on the perceptions why rich immigrants are rich – which is consistent with the fact that the experiment only focused on a poor, hard-working immigrant, and not on wealth and effort (see Appendix Table A-7). In addition, there is very small and barely significant effect on the perceived total share of immigrants, which could again be due to the treatment prompting people to think about immigrants overall.³⁷

³⁷Note that this treatment also slightly reduces the perceived share of Muslim immigrants. This could be because of the non Muslim name “Emma.” However, as described in Section 5.6, we randomized the name in a smaller pilot and found no difference in the effect of the treatment on views about redistribution.

5.3 Persistence of the Effects

We also ran a follow-up survey to check how persistent the effects on perceptions were. We limit ourselves to the U.S. for this exercise and send out follow-up survey invitations to respondents one week after they take the first survey. 25% of the originally surveyed respondents end up taking the follow up between one and three weeks after the original survey. There is no strong selection on who took the follow-up; groups which in general have lower response rates, namely male, high-income, and young respondents are less likely to take the follow-up (see Appendix Table A-13.)

Table 5 shows the results. The treatment “hard work of immigrants” displays very strong persistence. The treatment effect on respondents who took the first and follow-up survey is almost identical in the first and follow-up surveys. The treatment “Origins of immigrants” also persistently affects the perceived share of Middle Eastern and North African immigrants (negatively) and the perceived share of Latin American immigrants (positively). The treatment “Share of immigrants” does not show persistent effects.

Perhaps the reason is that the “Share of immigrants” treatment is difficult to remember because it shows a precise number. On the other hand, the “Hard work” treatment may be the easiest for respondents to remember, as it does not require the memorization of any number, but simply conveys a message that is easy to hold on to. Treatment “Origins of immigrants” also does not require the memorization of an exact number, but rather conveys an impression about the share of immigrants from each region – respondents seem to easily remember this information as well.

5.4 Second Stage Effects of the Informational Treatments

The rest of Table 3 shows a selection of the main results of the three informational treatments on respondents’ views about immigration and redistributive policies, as well as the interactions of each informational treatment with having seen the Immigration block first. We show the effects of all the treatment combinations on the overall immigration support index, on whether respondents think immigration is not a problem, on the redistribution index, on whether respondents think that inequality is a serious problem, and on donations to charity.³⁸

Let us first consider the effects of the informational treatments on respondents who were not made to think about all the characteristics of immigrants first, i.e., on those respondents who saw the Redistribution block first.

All treatments affect support for immigration positively, and treatments “Share of immigrants” and “Hard Work of Immigrants” significantly so. Showing respondents information about the true number of immigrants increases support for immigration by 0.03, equivalent to 6.5% of the gap between left and right-wing respondents and the share of respondents who say that immigration is not a problem by 10% relative to the control group. Showing them an example of a hard-working immigrant increases support for immigration by even more, namely 11% of the left-right-wing gap. Thus, when respondents are informed about the correct number of immigrants and prompted to re-evaluate positively the work effort of immigrants, they seem to feel that immigration is less of a problem and become more supportive of pro-immigration policies.

Only the “hard work” treatment has a very significant positive effect on the redistribution index: treated respondents have a higher redistribution index by an amount equal to 11% of the gap between left and right-

³⁸In Appendix Tables A-8 and A-9, we show the outcomes on all the components of the redistribution and immigration support indices.

wing respondents. The other two treatments have essentially zero effect on support for redistribution.³⁹ Overall, these causal patterns are in line with our findings from Section 4 about the correlation of support for redistribution with perceptions, which was strongest for perceptions related to the economic contributions and hard work ethic of immigrants.

The way we interpret these results is as follows. The informational treatments each do two things: First, they unavoidably prime respondents to think about immigration, before they answer the questions on policies and redistribution, and they do so by focusing on one particular dimension of immigrants above others (their share, origin, or hard work). They can thus each be viewed as containing a mild version of our “order treatment” (which makes respondents think about the full array of immigrant characteristics), and which we know already makes respondents significantly less likely to support redistribution. Consistent with this idea is that the first stage effects of the “origins” and “hard work” treatments on the perceived share of immigrants was positive, as discussed above. Therefore, it is possible that even this milder priming effect of our info treatment would be negative. Second, however, these treatments also provide some piece of reassuring information about immigrants, which could improve support for redistribution. The overall treatment effect is the sum of these two forces. The fact that treatments “Share of immigrants” and “Origins of immigrants” have no significant effect on redistribution could simply mean that the positive information about immigrants manages to counteract the negative effect of priming respondents to think about immigrants. The treatment on “Hard work of immigrants” manages to more than compensate and generates a positive overall effect on redistribution; the total effect of reminding the respondent of immigrants, but at the same time giving him positive information on their effort makes him more favorably inclined to redistribution.⁴⁰

Why are the Share and Origins of immigrants treatments weaker overall? Regarding the former, the causal effect is in line with the insignificant or mildly positive correlation of the perceived share of immigrants and support for redistribution, conditional on the perceived composition of immigrants in Section 4. This is why we conjectured that it is not the number of immigrants per se – at least not in the ranges considered – but rather their characteristics that matter for redistribution preferences. The Origins treatment may have been less direct, and thus less impactful, than telling people directly the share of immigrants of different religions or ethnicities. Finally, these two treatments are more factual and perhaps harder to understand than the simple anecdote, a conjecture confirmed by the persistence results which are strongest for the Hard Work treatment. This is also confirmed by an IV strategy, in which we instrument for the perceived share of immigrants, the perceived share of Muslims, and the dummy for whether the respondent believes lack of effort is the reason why immigrants are poor, respectively, using the Share, Origins, and Hard Work treatments. We find that the effects of the perceived share of immigrants and perceived share of Muslims are simply imprecise. The effects of the Hard Work treatment are even stronger when using an IV.⁴¹

Next, consider the interaction effects of the informational treatments with having seen the immigration

³⁹A permutation test confirms that the treatment “Hard work of immigrants” has significantly positive effects on all components of the Immigration and Redistribution support indices. The test gives a p-value of 0.004 for the “Hard work” treatment, while the tests for the “Share of Immigrants” and the “Origins of Immigrants” treatments return a p-value of 0.501 and 0.744, respectively. Details on these tests are available upon request. The results for the “legal only” version of the treatment “Share of Immigrants” in Table A-6 are very similar and there is again no significant effect on support for redistribution, despite the stronger first stage.

⁴⁰An alternative explanation is of course that the effects of the milder priming and the positive info content are both zero. These conjectures could be tested with a different experimental design, in which one would simply ask about the share, origin, or hard work of immigrants only, without providing any info.

⁴¹We do not spend space on this IV strategy because it does not necessarily satisfy the exclusion restriction: the treatment may be shifting other perceptions too, e.g., increase the perceived share of immigrants due to salience. The monotonicity is almost perfectly satisfied since misperceptions almost all go in the same direction. These results are available on demand.

block first. None of the informational treatments manage to overcome the very negative effects on support for redistribution of making respondents think in detail about various characteristics of immigrants before answering redistribution questions. This is true even for the strong “hard work treatment,” for which the negative priors entirely cancel the positive effect of the favorable information.

To sum up, asking respondents about a series of characteristics of and attitudes towards immigrants before asking them about redistribution makes them significantly less favorable to redistributive policies. Presumably, this is due to the very negative baseline views they hold about immigrants, which are made salient as they go through our detailed questions. Providing some piece of reassuring information about immigrants on top of this – whether their actual number, their actual origins, or their hard work – does not manage to counteract the negative effect on support for redistribution.

5.5 Heterogeneity in Treatment Effects

Table 6 shows the heterogeneity in treatment effects according to three key respondent characteristics, which we highlighted in Section 3: left and right-wing respondents (Panel A); college and non college-educated (Panel B); college-educated in immigration intensive sectors and others (Panel C). We focus here on the effects of the “Order” treatment and the “Hard work” treatment (on those respondents who see the redistribution questions first), which are the two treatments with the most significant effects in the overall sample.⁴²

The groups which react most negatively to seeing the immigration block first are those with the most negative priors about immigrants, namely the right-wing, the non college-educated, and the non college-educated in high-immigration sectors: these groups want to reduce government-based redistribution and private charity donations by more. Note that right-wing respondents react to this treatment by strongly reducing the charity donations only. This can be seen as a more “right-wing” way of redistributing income without relying on the government.

Second, almost all groups respond positively to the “hard work of immigrants” treatment by increasing their support for redistribution, as was the case for the full sample. However, those same groups which have the more negative baseline views of immigrants also seem harder to convince to support more redistribution: they react less in the positive direction on the redistribution margin, after seeing the favorable information on the hard work of immigrants. The non college-educated in immigration-intensive sectors for instance – who hold especially negative views of immigrants – are not moved at all to support more redistribution by the favorable “hard work” treatment.

5.6 Summary of Robustness Checks

To conclude, we summarize in one place the robustness checks we do on all the results in Sections 3 - 5, which were alluded to before. We check that dropping respondents who (i) spend too little time on the survey, or ii) felt that the survey was biased (based on their response to the feedback questions at the end of the survey), or (iii) give extreme answers to the perception questions does not significantly change our results.⁴³ Due to strict space constraints, the full set of results for these alternative respondent samples are

⁴²The other treatments did not have differential effects by respondent groups and the overall effects from the full sample carry over.

⁴³Dropping respondents who felt the survey was biased strengthens the significance of the treatment effects, perhaps because the remaining respondents are more receptive to what they perceive to be non-biased information.

available on demand.

In a smaller pilot study, we randomize the names given as examples of immigrants in the question about whether immigrants receive more transfers on net (see Section 3.2). We also randomized the name of the immigrant whose story is told in the hard work treatment between i) a native-sounding name (“Emma”); ii) a Hispanic sounding name (“Isabella”) for the U.S. and an Eastern European name for European countries; and iii) a Muslim-sounding name (“Fatima”). The effects of the “Hard work” treatment were not significantly different across the three name groups, but the samples were small.

Finally, we re-weight the sample to make it representative also along the two non-targeted dimensions of education and employment. As a result, the sample is representative along all important dimensions. These results are in Appendix A-11.

6 Conclusion

According to our surveys, natives from six developed countries have strongly biased views about immigrants. They think that there are many more immigrants than there actually are. They also have incorrect views about the origins of immigrants: they overestimate the share of immigrants from the Middle East, North Africa, and the share of Muslim immigrants, and they sharply underestimate the share of Christian immigrants. Natives also believe that immigrants are poorer, more reliant on the host country’s welfare state, more unemployed, and less educated than they actually are. All these misperceptions contribute to making natives more averse to redistribution, as they perceive that immigrants are culturally and religiously more distinct from them and that they benefit disproportionately from the generosity of the welfare state. Respondents who know an immigrant personally have more accurate perceptions; the opposite holds for respondents who live in high immigration areas, although both of these margins are endogenous. Misperceptions about immigrants, and the subsequent lack of support for immigration and redistribution, are starkest among three groups of respondents: the non college-educated, the non college-educated working in immigration intensive sectors, and right-wing respondents.

Given the very negative priors that people have of immigrants, our randomized order treatment that prompts respondents to think about immigration and immigrants’ characteristics generates a significant negative effect on support for redistribution. Respondents who are shown that at least some immigrants are very hard-working become significantly more favorable to redistribution. However, if respondents are also first prompted to think in detail about immigrants’ number and composition, then none of the favorable information treatments is able to compensate for the negative priors that resurface and that lower support for redistribution.

These results suggest that much of the political debate about immigration takes place in a world of misinformation. Citizens and voters have distorted views about the number, the origin, and the characteristics of immigrants. The amount and nature of information that citizens receive is endogenous. Anti-immigration parties have an incentive to maintain and even foster the extent of misinformation. Because information is endogenous, a vicious cycle of disinformation may arise. The more natives are misinformed, the more they become averse to immigrants and redistribution, and the more they may look for confirmation of their views in the media. As a result, the media has an incentive to offer information supporting these views. For instance, immigrants who commit crimes or who free-ride on the welfare system may receive more media coverage than non-immigrants doing the same.

Another implication of our results could be that a focus on immigration issues in the current political debate – if it does not go hand in hand with correcting the striking misperceptions respondents have about immigrants – could have the unintended consequence of reducing support for redistribution, in addition to reducing support for more open immigration policies. In addition, anti-redistribution parties, even those not averse to immigration *per se*, can play the immigration card to generate backlash against redistribution.

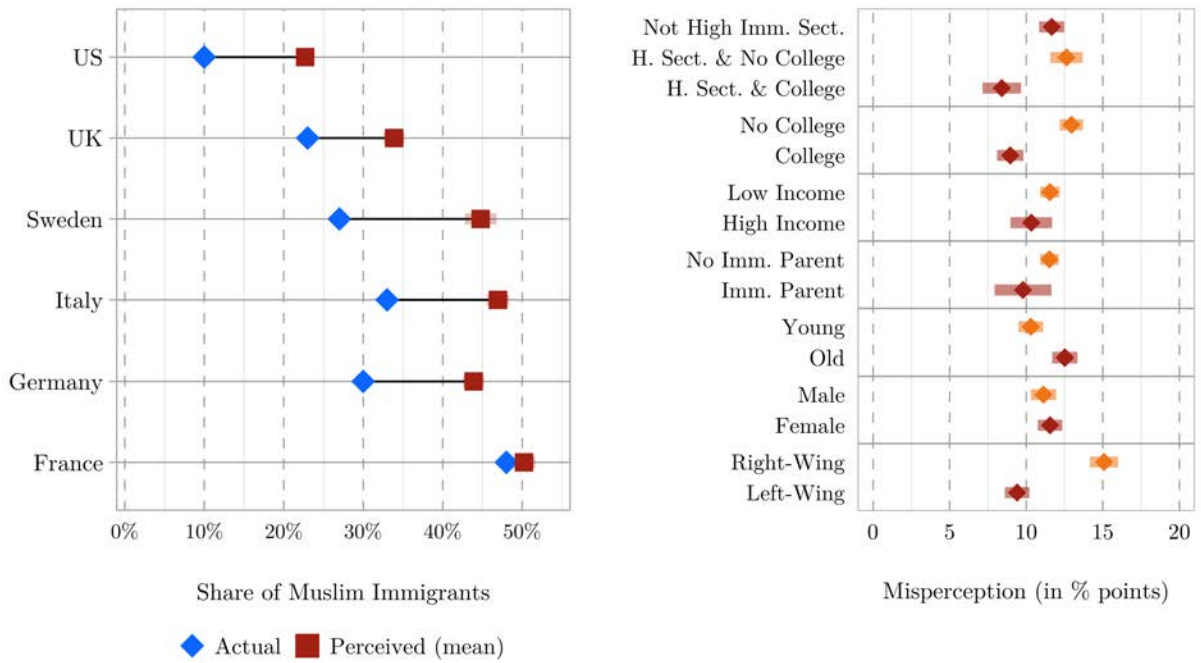

FIGURE 6: PERCEIVED VS. ACTUAL SHARE OF IMMIGRANTS

Notes: The left panel shows the average perceived share of immigrants (red squares) and the actual share (blue diamonds) in each country. The right panel shows the average misperception (perceived minus actual share) of the share of immigrants by groups. Groups are defined by the indicator variables listed to the left: the mean misperception when the indicator is equal to 1 is represented by the orange or red diamonds. The shaded areas are 95% confidence intervals around the mean.

FIGURE 7: PERCEIVED VS. ACTUAL RELIGION OF IMMIGRANTS

(A) PERCEIVED VS. ACTUAL SHARE OF MUSLIM IMMIGRANTS

(B) PERCEIVED VS. ACTUAL SHARE OF CHRISTIAN IMMIGRANTS

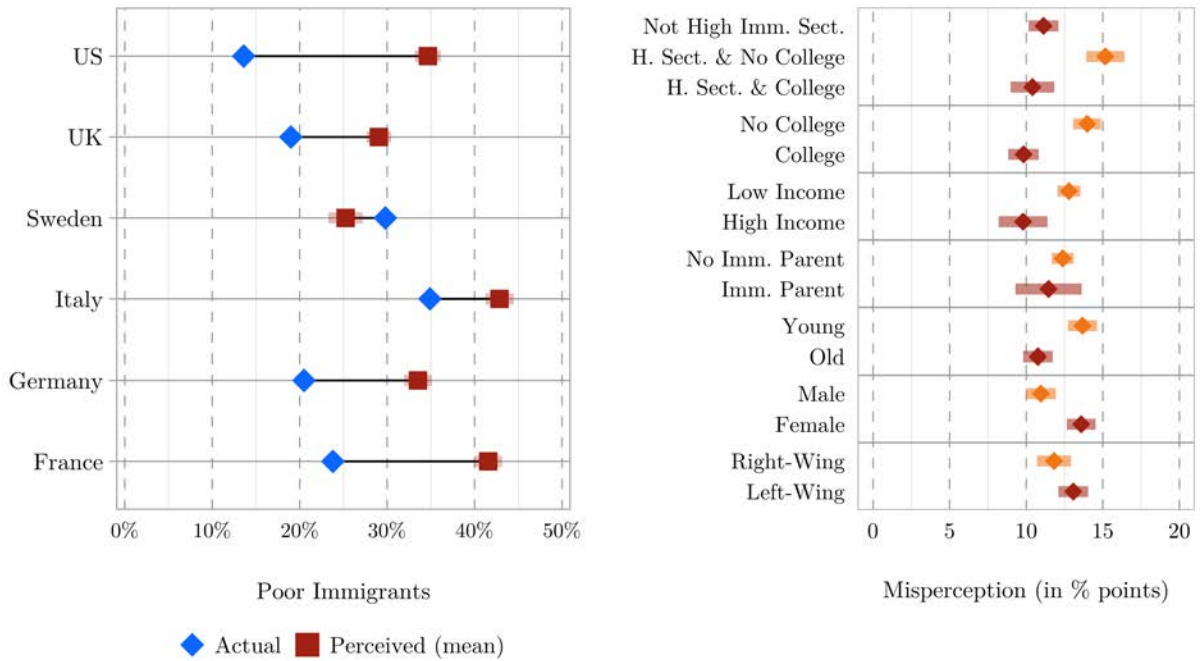

Notes: Panel A shows the perceived and actual share of Muslim immigrants; panel B shows the perceived and actual share of Christian immigrants. See the notes for Figure 6.

FIGURE 8: PERCEIVED VS. ACTUAL ECONOMIC CIRCUMSTANCES OF IMMIGRANTS

(A) PERCEIVED VS. ACTUAL SHARE OF UNEMPLOYED IMMIGRANTS

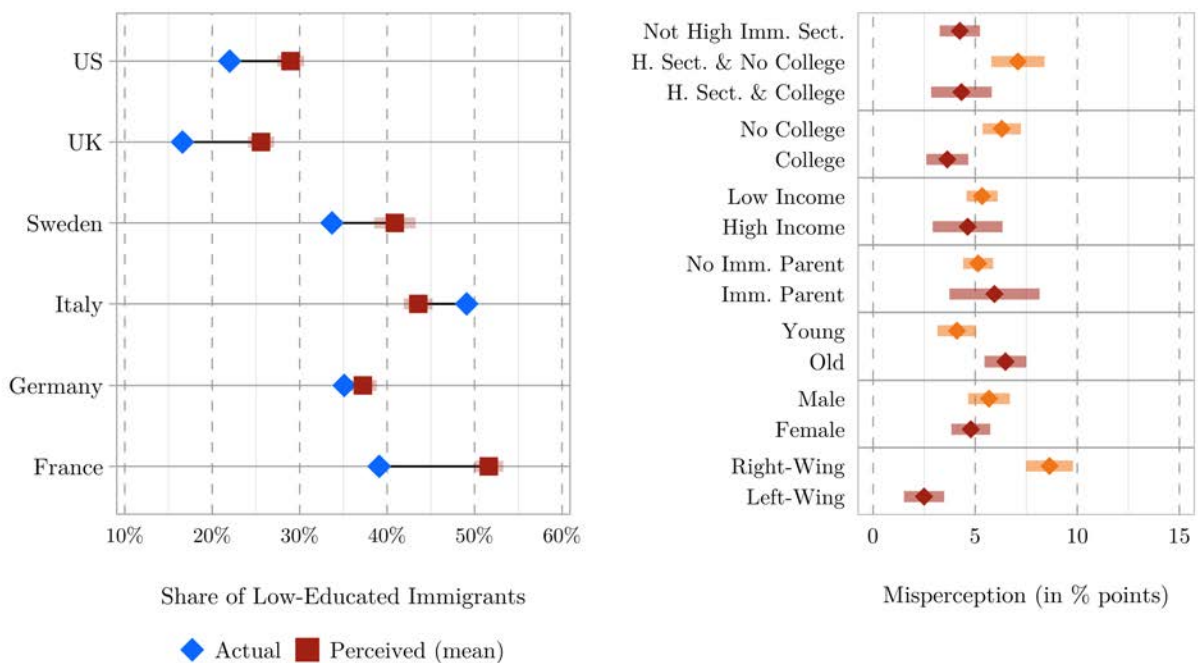

(B) PERCEIVED VS. ACTUAL SHARE OF POOR IMMIGRANTS

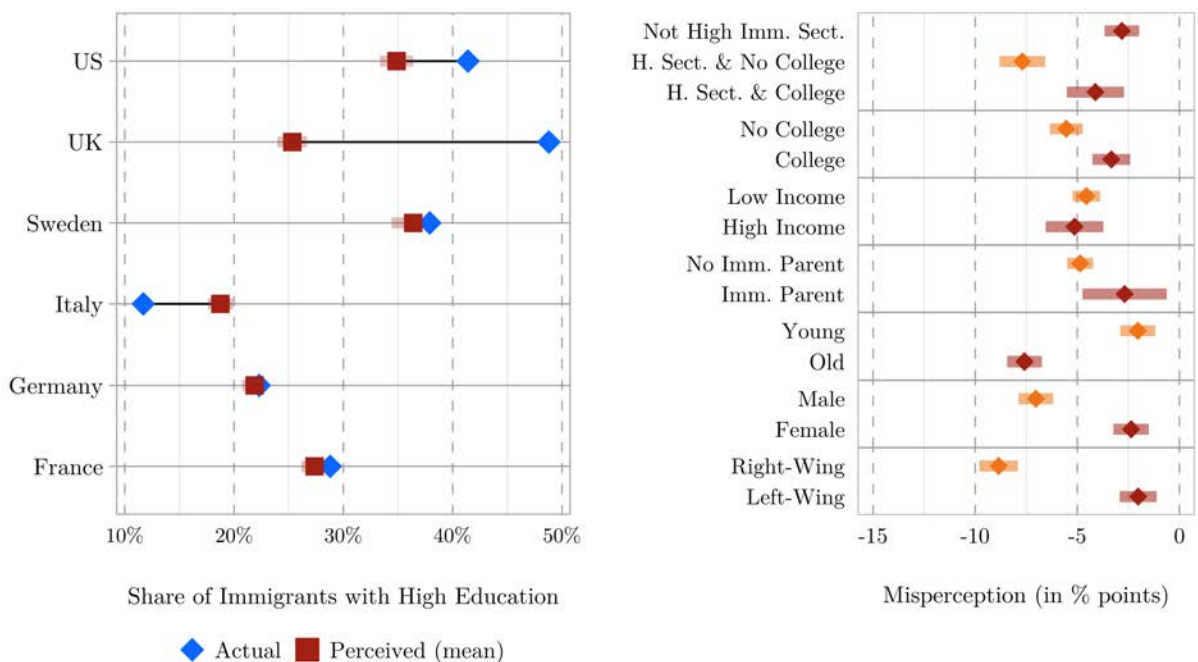

Notes: Panel A shows the perceived and actual immigrants' unemployment rate: panel B shows the perceived and actual share of immigrants who live in poverty. See the notes for Figure 6.

FIGURE 9: PERCEIVED VS. ACTUAL EDUCATION OF IMMIGRANTS

(A) PERCEIVED VS. ACTUAL SHARE OF LOW-EDUCATED IMMIGRANTS

(B) PERCEIVED VS. ACTUAL SHARE OF HIGHLY EDUCATED IMMIGRANTS

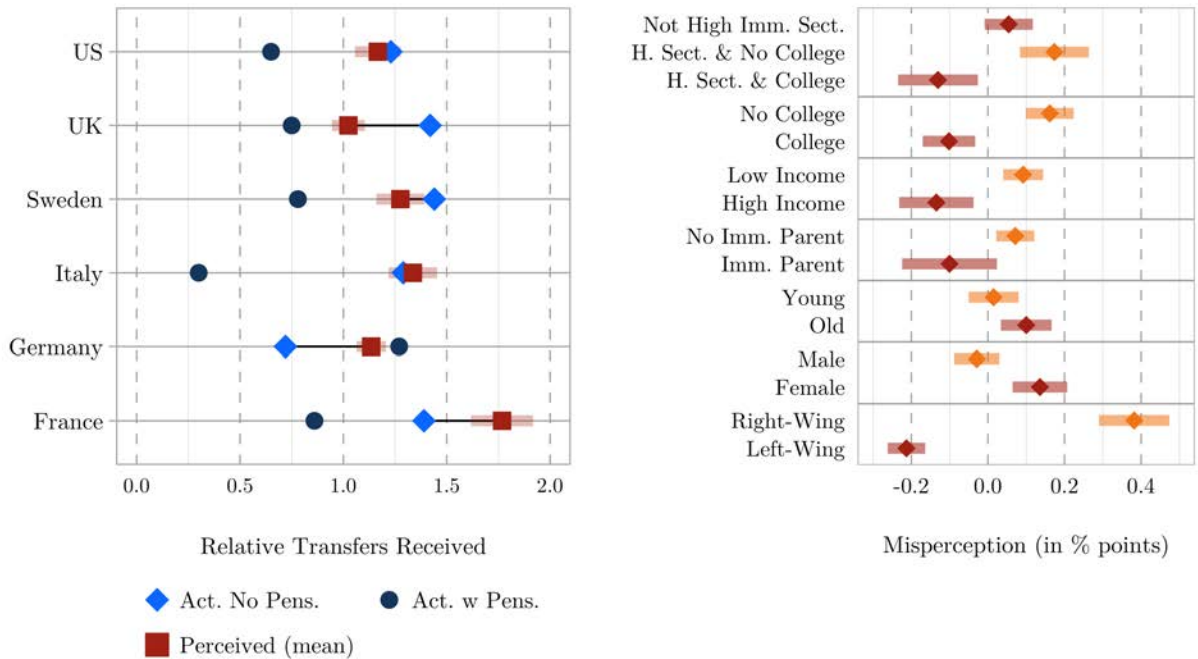

Notes: Panel A shows the perceived and actual share of immigrants who have not completed high-school; panel B shows the perceived and actual share of immigrants with a college degree. See the notes for Figure 6.

FIGURE 10: ARE IMMIGRANTS THE BENEFICIARIES OF REDISTRIBUTION?

(A) PERCEIVED VS. ACTUAL REPRESENTATION OF IMMIGRANTS AMONG POOR & LOW-EDUCATED

(B) PERCEIVED VS. ACTUAL RELIANCE ON GOV. TRANSFERS OF IMMIGRANTS RELATIVE TO NATIVES

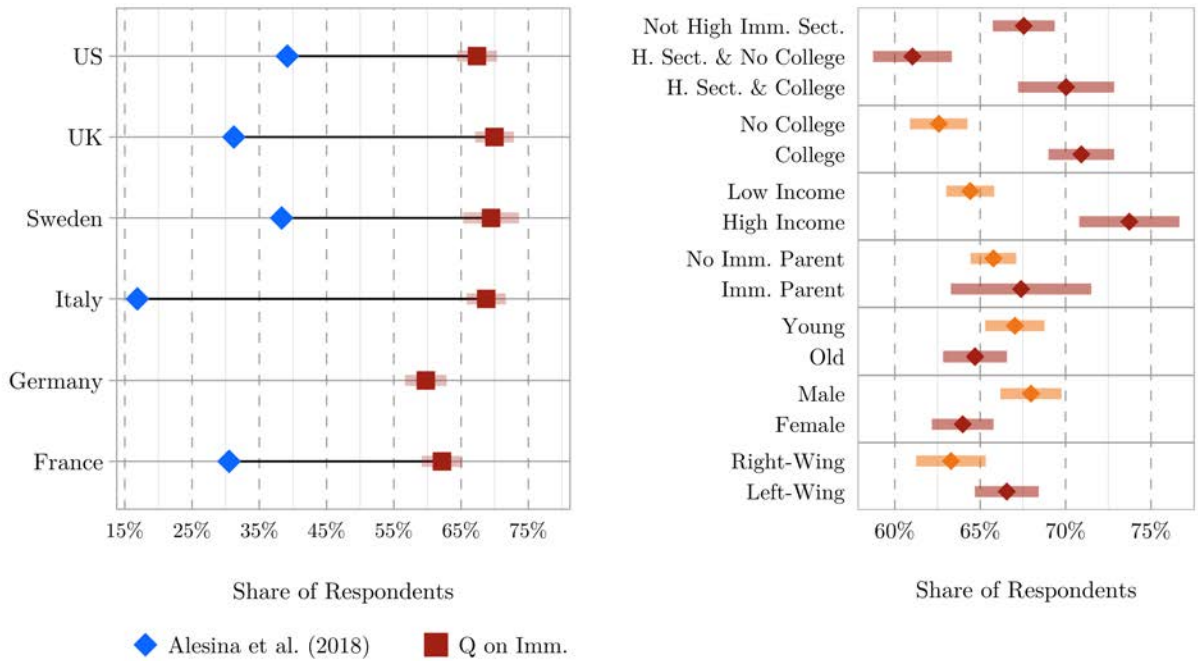

Notes: Panel A shows the perceived share of poor people who are immigrants, on the left, and the perceived share of low educated people who are immigrants, on the right; Panel B shows the perceived government transfers received by an average immigrant relative to the average native. Actual government transfers are represented by diamonds (excluding pension benefits) or circles (including pension benefits). See the notes for Figure 6.

FIGURE 11: VIEWS ON IMMIGRANTS' WORK EFFORT

(A) % OF RESPONDENTS WHO THINK IMMIGRANTS (OR NATIVES) ARE POOR DUE TO LACK OF EFFORT

(B) % OF RESPONDENTS WHO THINK IMMIGRANTS (OR NATIVES) ARE RICH BECAUSE OF OWN EFFORT

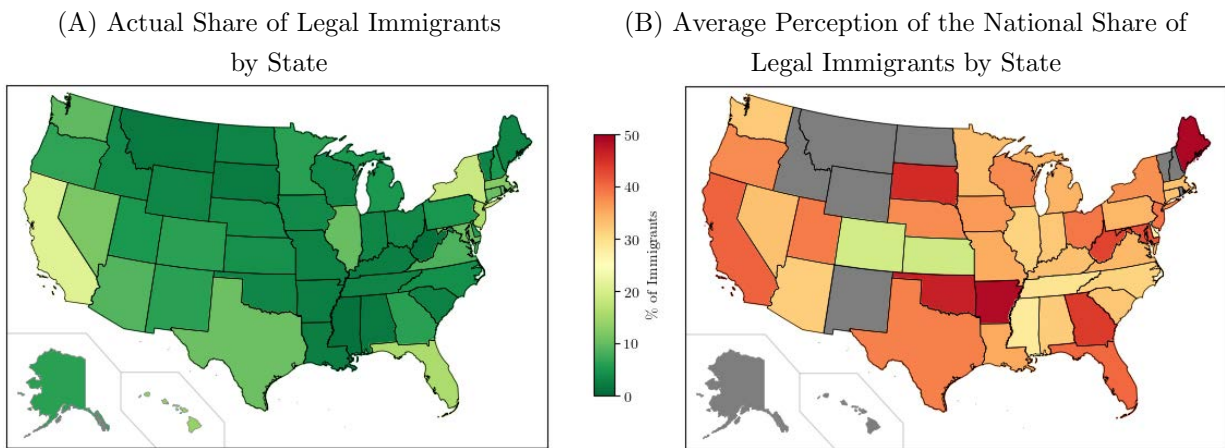

Notes: Panel A shows the share of respondents who think that immigrants who are poor are in that situation because of lack of effort, by country (left panel) and by groups (right panel). Panel B shows the share of respondents who think that immigrants who are rich owe this to their own effort. Blue diamonds report the share of respondents who say the same about the general, non-immigrant population, with numbers coming from Alesina et al. (2018). In the right panel, groups are defined by the indicator variables listed to the left: the share when the indicator is equal to 1 is shown in orange or in red. The shaded areas are 95% confidence intervals around the average perception.

FIGURE 12: MOHAMMAD RECEIVES MORE ON NET

Notes: The figure shows the share of respondents who think that Mohammad receives more benefits on net (i.e., either receives more gross benefits or pays less taxes). See notes for Figure 11.

FIGURE 13: MISPERCEPTIONS ACROSS U.S. STATES:

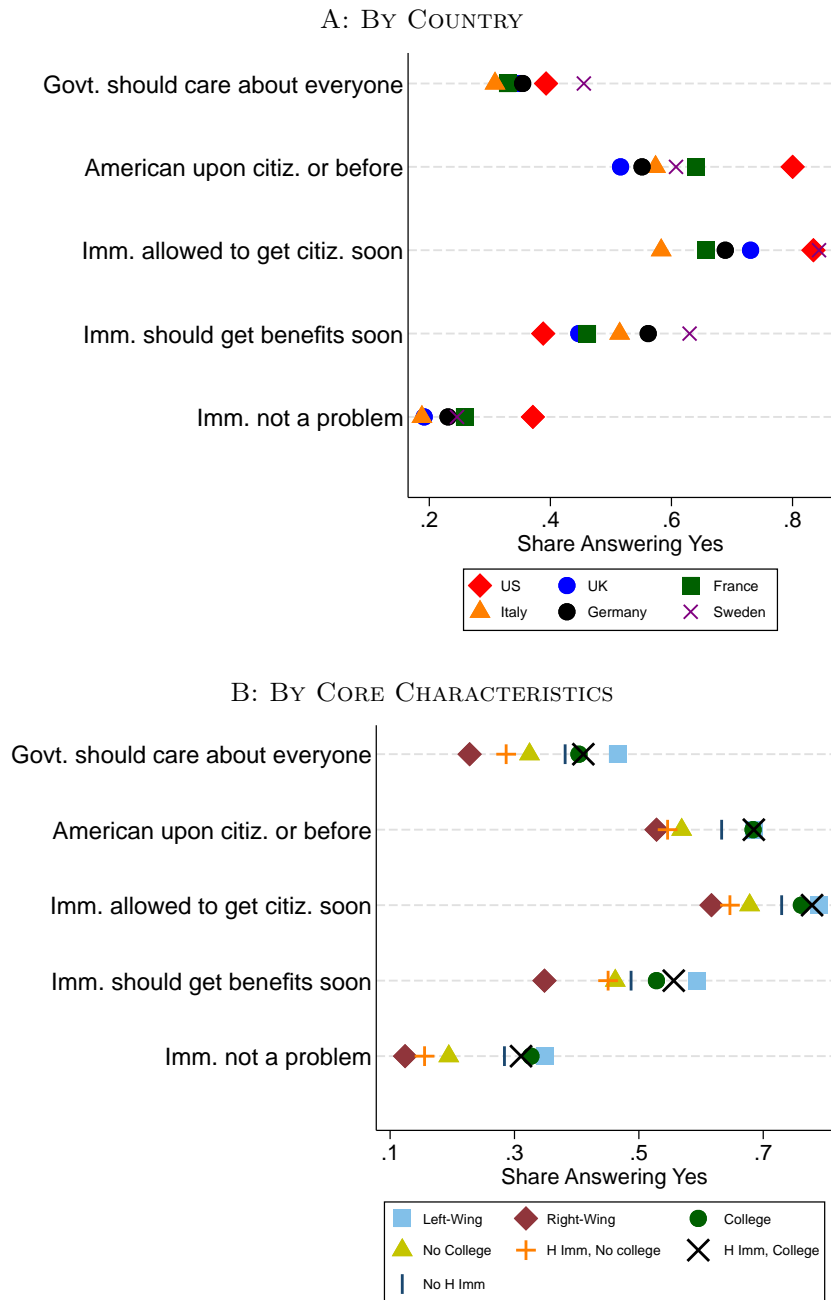

Notes: Panel A shows the actual share of legal immigrants in each state in 2014 (Source: Pew Research Center). Panel B shows, for each state, the average perception of the national share of legal immigrants for respondents in that state. The actual national share of legal immigrants is 10%.

FIGURE 14: PERCEIVED SHARE OF IMMIGRANTS AND CZ LEVEL CHARACTERISTICS

Notes: The figure shows the coefficients β from the regression: Perceived share of Immigrants_{*i*} = $\alpha + \beta A_i + \gamma X + \varepsilon_i$ where the left-hand side is the respondent's perceived share of immigrants, A_i is the full set of z-scores of the variables listed vertically, and X are all individual level controls (income, education, political affiliation, etc.), including dummies for whether the respondent is African-American or Hispanic. The shaded areas are 90% confidence intervals.

FIGURE 15: SUPPORT FOR IMMIGRATION

Notes: The figure shows the share of respondents answering “Yes” to the questions listed on the vertical axis, by country (Panel A) and respondent groups (Panel B). *Govt. should care about everyone* is a dummy equal to 1 if the respondent thinks that the government should care about all the people living in the country (6 and 7 in a scale from 1 to 7). *American upon citiz. or before* is a dummy equal to 1 if the respondent would consider an immigrant truly “American” at the latest when he gets citizenship. *Imm. allowed to get citiz. soon*, *Imm. should get benefits soon*, and *Imm. not a problem*, are dummies equal to 1 if the respondent thinks that immigrants should be allowed to apply for citizenship at most five years after arriving, immigrants should be eligible for benefits at most three years after arriving, and immigration is not a problem.

FIGURE 16: SUPPORT FOR IMMIGRATION AND SUPPORT FOR REDISTRIBUTION

Panel A: Correlation between support for immigration and redistribution

Panel B: Perceived share of poor who are immigrants and support for redistribution

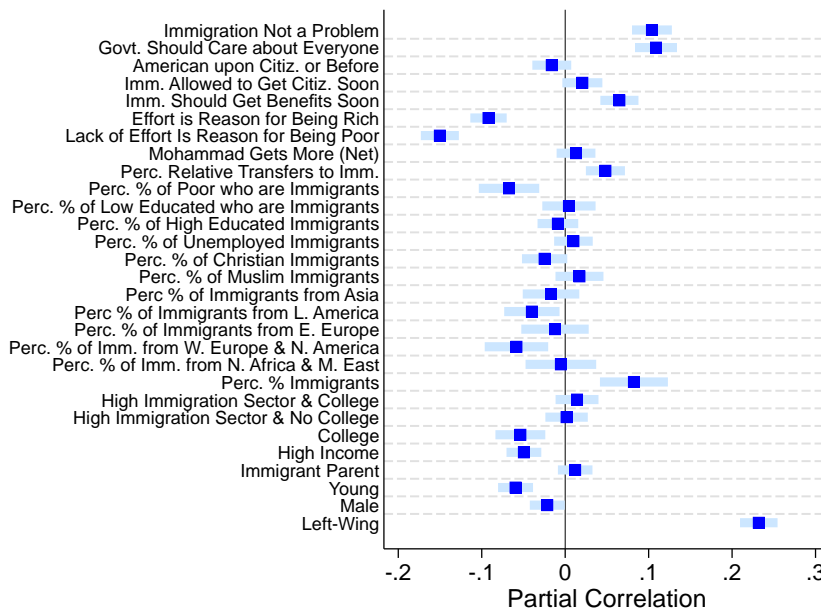

Notes: Binscatter of the Redistribution Support index against the Immigration Support index (top panel) and the perceived share of poor people in the country who are immigrants (bottom panel). Indices are constructed following the methodology in Kling et al. (2007), as explained in detail in Section 4. Each dot is the average residual in each bin from regressing respondents' redistribution and immigration indices on \mathbb{X} , i.e., all individual level controls (income, education, political affiliation, etc.), including country fixed effects; in the bottom panel we also add as controls all variables from Panel B of Figure 17. The fitted line and reported coefficient β come from the regression: $\text{Support for Redistribution}_i = \alpha + \beta \text{Support for Immigration}_i + \gamma \mathbb{X} + \varepsilon_i$. Standard error in parenthesis. *** $p < 0.01$.

FIGURE 17: WHAT CORRELATES WITH SUPPORT FOR IMMIGRATION AND REDISTRIBUTION?

Panel A: Support for Immigration

Panel B: Support for Redistribution

Notes: Panel A shows the coefficients β from the regression $\text{Immigration Support index}_i = \alpha + \beta A_i + \text{country fixed effects} + \varepsilon_i$ where the left-hand side is the respondent's Immigration support index and A_i is the full set of z-scores of the variables listed vertically, which includes perceptions of immigrants, as well as personal characteristics. Panel B shows the coefficients β from a similar regression where the Redistribution Support index is the dependent variable. This regression includes all the variables in Panel A, as well as views on immigration policy (see notes for Figure 15). *Govt. Should Care About Everyone* ranges from 1 to 7, where 1 means that the respondent thinks the government should only care about natives and 7 means that he thinks the government should care about all the people living in the country. Shaded areas are 90% confidence intervals. See notes for Figure A-7.

Notes: This table displays summary statistics from our surveys (in odd columns) alongside nationally representative statistics (in even columns). Detailed sources for each variable and country are: 1) For the U.S.: The Census Bureau and Current Population Survey. Income brackets (annual gross household income) are defined as less than \$20,000; \$20,000-\$40,000; \$40,000-\$70,000; more than \$70,000. 2) For the U.K.: Eurostat Census Data and Office of National Statistics. Income brackets (monthly net household income) are: less than £1,500; £1,500-£2,500; £2,500-£3,000; more than £3,000. 3) For France: Eurostat Census Data and INSEE. Income brackets (monthly net household income, in Euros) are: less than 1,500; 1,500-2,500; 2,500-2,000; more than 3,000; 4) For Italy: Eurostat Census Data, Bank of Italy and ISTAT. Income brackets (monthly net household income, in Euros) are: less than 1,500; 1,500-2,450; 2,450-3,350; more than 3,350; 5) For Germany: Eurostat Census Data and GfK Demographics. Income brackets (monthly net household income, in Euros) are: less than 1,500; 1,500-2,600; 2,600-4,000; more than 4,000; 6) For Sweden: Eurostat Census Data and Statistics Sweden. Income brackets (monthly gross household income, in SEK) are: less than 33,000; 33,000-42,000; 42,000-58,000; more than 58,000. We count as employed both full-time and part-time employees. Out of the labor force = 1 - (employed + unemployed).

TABLE 2: ABILITY OF COVARIATES TO PREDICT TREATMENT STATUS

	Imm Q First		Share of Immigrants		Origins of Immigrants		Hard Work of Immigrants	
	Coefficient	P-value	Coefficient	P-value	Coefficient	P-value	Coefficient	P-value
Voted right	-0.006	0.436	-0.001	0.888	0.004	0.548	-0.006	0.325
Voted left	0.002	0.820	-0.003	0.668	-0.002	0.758	0.009	0.150
Male	0.009	0.168	-0.003	0.588	0.002	0.721	-0.000	0.999
Young	-0.001	0.918	0.009	0.130	-0.003	0.671	-0.011	0.063
Immigrant parent	0.009	0.479	0.003	0.738	0.002	0.875	-0.013	0.195
College degree	-0.001	0.887	0.011	0.088	0.001	0.934	-0.011	0.087
High income	-0.006	0.516	0.001	0.857	-0.003	0.732	-0.005	0.558
High immigration sector	-0.005	0.485	0.004	0.518	-0.004	0.537	-0.002	0.769

Notes: The table shows the coefficients and p-values from a series of regressions of the form $y_{ic} = \alpha + \beta Covariate_i + \gamma_c + \epsilon_{ic}$, where $Covariate_i$ is the variable listed in the row and γ_c are country fixed effects. In the column “Imm Q First”, y_{ic} is a dummy equal to one if the respondent was shown the Immigration block before the Redistribution block. In columns “Share of Immigrants”, “Origins of Immigrants”, and “Hard Work of Immigrants” y_{ic} is a dummy equal to one if the respondent saw the corresponding informational treatment.

TABLE 3: TREATMENT EFFECTS ON SUPPORT FOR IMMIGRATION AND REDISTRIBUTION

	Imm Support Index (1)	Imm Not A Problem (2)	Redistribution Index (3)	Inequality Serious Problem (4)	Donation Above Median (5)

Observations	20049	20011	20049	20047	20049
Control mean	0.00	0.25	0.00	0.57	0.45

Notes: The table reports the effect of the Order treatment and the three information treatments, as well as their interactions on the variables in the columns. Outcome variables are described in Appendix A-1. Controls included in all regressions are: indicator variables for gender, age less than 45, having children, being in the top quartile of the income distribution, having a college degree, political affiliation, having at least one parent not born in the country, working in a high immigration sector, and country fixed effects. Standard errors in parentheses. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

TABLE 4: FIRST STAGE TREATMENT EFFECTS ON PERCEPTIONS

	All Immigrants (misp.) (1)	Accurate Perception All Immigrants (2)	M. East and N. Africa (misp.) (3)	N. America, W. and E. Europe (misp.) (4)	Muslim (misp.) (5)	Christian (misp.) (6)	Lack of Effort Reason Poor (7)
Share of Immigrants	-4.716*** (0.421)	0.224*** (0.00559)	-0.255 (0.304)	0.184 (0.355)	0.00816 (0.407)	0.146 (0.395)	0.00164 (0.00909)
Origins of Immigrants	2.314*** (0.422)	0.00285 (0.00560)	-4.762*** (0.304)	1.785*** (0.355)	-1.825*** (0.407)	2.471*** (0.395)	0.000912 (0.00909)

Control mean	17.02	0.04	12.60	-5.56	11.30	-23.98	0.36

Notes: The table reports first-stage effects on (mis)perceptions of immigration. Misperceptions are computed as perception minus actual statistic. *Accurate Perception All Immigrants* is a dummy equal to 1 if the absolute value of the respondent's misperception of the share of immigrants is less than 1. Appendix A-1 defines all variables. All regressions include the same controls as Table 3. Standard errors in parentheses. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

TABLE 5: FIRST STAGE EFFECTS: PERSISTENCE IN FOLLOW-UP (US ONLY)

	All immigrants (misp.) (1)	Accurate Perception All immigrants (2)	M. East and N. Africa (misp.) (3)	L. America (misp.) (4)	Muslim (misp.) (5)	Christian (misp.) (6)	Lack of Effort reason poor (7)

Notes: The Table reports the effects of the Order and the Hard Work of Immigrants treatments. The effects of the Order treatment are estimated only on the respondents who have not seen any informational treatment. The effects of the “Hard work” treatment are estimated only on respondents who see the redistribution block first. Panel A reports heterogeneous effects on Left-wing and on Right-wing respondent. The regressions also include a “Treatment x Center” interaction, not reported. Panel B reports the effects on respondents with a college degree and respondents without. Panel C reports the effects on respondents working in a high immigration sector who do not have a college degree, and on all the other respondents. “p-value diff.” is the p-value of the test of equality of treatment effects on the pairs of groups. All regressions include the same controls as Table 3. Standard errors in parentheses. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

Online Appendix [Not for Publication]

A-1 Variables Definitions

Core Respondents' Characteristics:

Male: respondent is male.

Female: respondent is female.

Young: respondent's age is below 45 years.

Old: respondent's age is above 45 years.

High Income: respondent's household income is in the top quartile of the household income distribution in the country.

Low Income: respondent's household income is not in the top quartile of the household income distribution in the country.

College: respondent has at least a college degree.

No College: respondent does not have a college degree.

Left-wing: respondent has voted or is planning to vote (in Italy and Sweden) for a party or presidential candidate classifiable as *Left* or *Far-Left*.⁴⁴

Right-wing: respondent has voted or is planning to vote (in Italy and Sweden) for a party or presidential candidate classifiable as *Right* or *Far-Right*.⁴⁵

Immigrant parent: dummy equal to one if at least one of the respondent's parents is not born in the country.

High Immigration Sector & No College: dummy equal to one if respondent works in an immigration-intensive sector and does not have a college degree. See Appendix A-3 for details on the sector classification.

High Immigration Sector & College: dummy equal to one if respondent works in an immigration-intensive sector and has a college degree. See Appendix A-3 for details on the sector classification.

Children: respondent has one or more children.

Perceptions of Immigration

Note: For all cross-country analyses we transform these variables into *misperceptions*, that is, we subtract the actual value of the variable in the data from the respondent's perception; a positive value represents an overestimation of the actual value, and a negative value represents an underestimation. See Section A-2 for a description of the data sources.

All Immigrants: perceived share of immigrants (according to the OECD definition of "foreign-born") in the country.

Share of Immigrants from ...: perceived share of immigrants born in, respectively, North Africa, Middle East, Western Europe, Eastern Europe, North America, Latin America, Asia, Sub-Saharan Africa, Oceania.

Share of Muslim/Christian immigrants: perceived share of immigrants of Muslim or Christian religion.

Share of Low-Educated immigrants: perceived share of immigrants without a high school diploma (in the U.S.) or equivalent in other countries.

Share of Low-Educated who are immigrants: perceived share of low educated people who are immigrants.

⁴⁴The candidates or parties that we classify as *Left* or *Far-Left* are: in the U.S., Clinton and Stein; in the U.K., Labour Party, Scottish National Party, Sinn Fein, Green Party and Party of Wales; in France, Arthaud, Hamon, Mélenchon and Poutou; in Italy, Democratic Party (PD), +Europa, Civica Popolare, Five Star Movement, Liberi e Uguali, Potere al Popolo; in Germany, SPD, Bündnis 90, Die Linke; in Sweden, Socialdemokraterna, Miljöpartiet, Vänsterpartiet, and Feministiskt Initiativ.

⁴⁵The candidates or parties that we classify as *Right* or *Far-Right* are: in the U.S., Trump and Johnson; in the U.K., Conservative Party, Democratic Unionist Party, Ukip; in France, Dupont-Aignan, Fillon, Le Pen; in Italy, Forza Italia, Fratelli d'Italia, The League; in Germany, CDU, AfD, ÖDP; in Sweden, Sverigedemokraterna, Liberalerna, Moderaterna, and Kristdemokraterna.

This perception is computed by combining the perceived share of low-educated immigrants, the perceived share of low-educated natives, and the perceived share of immigrants in the country.

Share of Highly Educated immigrants: perceived share of immigrants with at least a two-year bachelor degree in the U.S. or equivalent in other countries.

Share of Unemployed immigrants: perceived share of unemployed immigrants.

Share of Poor immigrants: perceived share of immigrants who live below the poverty line.

Share of Poor who are immigrants: perceived share of poor people who are immigrants. This perception is computed by combining the perceived share of poor immigrants, the perceived share of poor natives, and the perceived share of immigrants in the country.

Relative Transfers Received: perceived social benefits paid to immigrants relative to natives. This variable aggregates numerically the answers to the question “An average immigrant receives... *No transfers; One third as much as a U.S. born resident; Half [...]; As much [...]; Slightly more [...]; Twice [...]; Three times [...]; More than ten times [...].*”

Attitudes towards Immigration

Immigrants Poor due to Lack of Effort: dummy equal to 1 if the respondent thinks that an immigrant living in the country is poor because of lack of effort.

Immigrants Rich because of effort: dummy equal to 1 if the respondent thinks an immigrant is rich because he has worked harder than others.

Mohammad Gets More: dummy equal to 1 if the respondent thinks that Mohammad receives on net more than John – either receives more social benefits but pays weakly less taxes, or receives weakly more social benefits but pays less taxes.

Immigration Support

Imm. Not A problem: dummy equal to 1 if the respondent thinks that immigration is not a problem or not a problem at all.

Imm. Benefits Soon: dummy equal to 1 if the respondent thinks that immigrants should get social benefits on the same basis as natives at most three years after they arrive in the country.

Imm. Citizenship Soon: dummy equal to 1 if the respondent thinks that immigrants should be allowed to apply for citizenship at most five years after they arrive in the country.

American Upon Citizenship/Before: dummy equal to 1 if the respondent would consider an immigrant to be “truly American” as the latest when the latter gets citizenship.

Govt. Should Care about Everyone: variable ranging from 1 to 7 where 1 means that the respondent thinks the government should only care about natives in the country and 7 means that he thinks the government should care equally about all the people living in the country.

Support for Redistribution

Inequality Serious Problem: dummy equal to 1 if the respondent thinks that income inequality is a serious or very serious problem.

Govt. Should Care about Inequality: variable ranging from 1 to 7 where 1 means that the respondent thinks the government should not care at all about income inequality and 7 means that he thinks the government should do everything in its power to reduce inequality.

Schooling Favor: dummy equal to 1 if the respondent favors or strongly favors spending more money on schools in poor neighborhoods.

Housing Favor: dummy equal to 1 if the respondent favors or strongly favors spending more money to provide decent housing for those who cannot afford it.

Income Support Favor: dummy equal to 1 if the respondent favors or strongly favors spending more money on income support programs for the poor.

Tax Top1: respondent's preferred tax rate on the top 1% of the income distribution in his country.

Tax Bottom50: respondent's preferred tax rate on the bottom 50% of the income distribution in his country.

Budget Education: share of the government budget that the respondent would allocate to "Schooling and Higher Education."

Budget Health: share of the government budget that the respondent would allocate to public spending on Health.

Budget Safety Net: share of the government budget that the respondent would allocate to social insurance and income support programs.

Budget Pensions: share of the government budget that the respondent would allocate to Social Security, Medicare, Disability Insurance and Supplemental Security Income in the U.S. or equivalent spending items in the other countries.

Budget Housing: share of the government budget that the respondent would allocate to affordable housing programs.

Donation

Donation above Median: dummy equal to 1 if the respondent's donation amount is above the median in his country.

Total % donation: total amount the respondent wishes to donate to the charities, as a percentage of the potential prize (\$ 1000 in the U.S., 1000 pound in the U.K., 1000 euro in France, Italy and Germany, 10000 SEK in Sweden).

Commuting-zone-level variables

To construct commuting-zone-level variables we take data at the county-level from different sources and we aggregate them using the county-to-commuting zone crosswalk by David Dorn.

Unemp rate (2017): unemployment rate at the CZ level. Source: own calculations using the BLS Labor Force Data by County (2017).

Crime rate: Number of crimes reported in 2014 over total population. Source: own calculations on county-level data from the ICPSR *Uniform Crime Reporting Program Data 2014*.

Share Living in Rural area: share of people living in an area that is defined as "Rural". Source: own calculations on county-level data from the 2010 Census.

Share in Manufacturing: Fraction of employed persons 16 and older working in manufacturing. Source: own calculations on county-level data from the 2016 5-year ACS.

Share living in poverty: Fraction of population below the poverty line. Source: own calculations on county-level data from the 2016 5-year ACS.

Share of Hispanic People: Share of the population that is Hispanic. Source: own calculations on county-level data from the 2016 5-year ACS.

Share of Black People: Share of the population that is Black. Source: own calculations on county-level data from the 2016 5-year ACS.

Share of college-educated: Share of residents older than 25 and who have at least a Bachelor degree. Source: own calculations on county-level data from the 2016 5-year ACS.

Immigrants Inflow since 2010: Share of the population not born in the U.S. who has moved to the commuting zone in 2010 or after. Source: own calculations on county-level data from the 2016 5-year ACS.

Share of immigrants: Share of the population not born in the U.S.. Source: own calculations on county-level data from the 2016 5-year ACS.

The following variable is taken from [Chetty et al. \(2016\)](#). *Racial Segregation*: Multi-group Theil Index calculated at the census-tract level over four groups: White alone, Black alone, Hispanic, and Other. Source: 2000 Census.

Immigration Support and Redistribution Support Indices

Following the methodology in Kling, Liebman, and Katz (2007), each index consists of an equally weighted average of the z-scores of the policy outcomes variables related to immigration support (respectively, support for redistribution) with signs oriented so that more support for those policies means a higher corresponding index. Variables are transformed into z-scores by subtracting the control group mean and dividing by the control group standard deviation, so that each z-score has mean 0 and standard deviation 1 for the control group. The *Immigration support index* includes the z-scores of the 5 variables listed under *Immigration Support*. The *Redistribution support index* includes the z-scores of the 12 variables listed under *Support for Redistribution*.

A-2 Definitions, Data Sources and Construction of Actual Statistics about Immigrants

A-2.1 Definitions

Number, Origins and Religion of Immigrants

Share of immigrants: share of foreign-born in the country.

Origin of immigrants: share of the foreign-born residents in the country born in, respectively, North America, Latin America, Western Europe, Eastern Europe, North Africa, Middle East, Asia.

Religion of immigrants: share of foreign-born residents in the country who are of, respectively, Muslim and Christian religion.

Economic Circumstances of Immigrants

Share of Low Educated Immigrants: share of foreign-born population holding a qualification corresponding to ISCED 2011 levels 0-2 (in European countries) or having no high-school diploma in the U.S..

Share of High Educated Immigrants: share of foreign-born population holding a qualification corresponding to ISCED 2011 levels 5-8 (in European countries) or having at least an associate degree (two year bachelor degree in the U.S.).

Unemployment: Unemployment rate among the foreign-born in the country.

Poverty: U.S.: share of foreign-born population having income below the official Poverty Threshold.⁴⁶ European countries: share of foreign-born population with an adult-equivalent disposable income below the at-risk-of-poverty threshold, (60% of the national median disposable income).

Relative Transfers - No Pensions: Average amount of benefits paid per immigrant household divided by average amount of benefits paid per native household (2007-09). Benefits include social assistance (e.g., social exclusion allowance in E.U., public assistance and Medicaid in the U.S.), unemployment benefits, family allowances (e.g., family/child allowances in E.U., school lunch and food stamp benefits in the U.S.), housing benefits (e.g., housing allowance in E.U., housing subsidy in the U.S.).

Relative Transfers - With Pensions: as in the previous variable, but including pension benefits (e.g., old-age benefits in the EU, social security payments, supplementary security income and Medicare in the U.S.).

A-2.2 Data Sources and Construction

A-2.2.1 U.S.

For the U.S., the statistics which are readily available refer to total immigrants, both legal and illegal. We construct our statistics on legal immigrants only using data on the total immigrant population and esti-

⁴⁶See <https://www.census.gov/cps/data/povthresholds.html>

mates on illegal immigrants. Given that there is some uncertainty surrounding the characteristics of illegal immigrants, we provide bounds for each statistic, using several different data sources. All the raw data and our calculations are available in the excel spreadsheet at https://www.dropbox.com/s/136otycl3tnkdsd/Database_US.xlsx?dl=0.

Number and Origins of Immigrants

Share of total immigrants: 13.4% (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)

Share of legal immigrants: 10%, computed as:

$$\frac{\text{Number of foreign born in the U.S.} - \text{Number of illegal foreign born}}{\text{Total U.S. population}}$$

- Number of foreign born in the U.S. in 2015 = 43,158,110 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegal foreign born in the U.S. in 2015 = 11,000,000 (Source: Pew 2017)⁴⁷
- Total U.S. population in 2015 = 321,418,821 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)

The estimate of the unauthorized immigrant population in 2015 by Pew is consistent with the estimate provided by the Center for Migration Studies (11,042,503) and close to the estimate of the Migration Policy Institute for 2014 (11,009,000).

Origins of legal immigrants: for each area X, computed as:

$$\frac{\text{Number of immigrants from area X} - \text{Number of illegal immigrants from area X}}{\text{Number of immigrants in the U.S.} - \text{Number of illegals in the U.S.}}$$

- Number of immigrants from area X in 2015 – See excel spreadsheet (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of immigrants in the U.S. in 2015 = 43,158,110 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegal immigrants from area X in 2015 – See excel spreadsheet (Source: Pew 2017)⁴⁸
- Number of illegals in the U.S. = 11,000,000 (Source: Pew 2017)

The Pew Research Center reports the number of illegal immigrants for all of the regions we consider in our analysis. However, the aggregate number of illegal immigrants is reported jointly for 1) Europe & Canada, and for 2) Middle East & North Africa. To obtain the shares of legal/illegals for Western Europe, Eastern Europe, Canada, the Middle East, and North Africa separately, we attribute them a share of illegal immigrants in proportion to their share of total immigrants within the larger areas reported by Pew. We obtain the following shares of legal immigrants: Canada: 2.3%; Western Europe: 7.7%; Eastern Europe: 6.2%; Middle East: 4.15%; North Africa: 0.3%. We can compute a very strict lower bounds by attributing all the illegals from the larger Pew areas to each of our areas in turn (e.g., attribute all illegals from Europe

⁴⁷<http://www.pewresearch.org/fact-tank/2017/04/25/as-mexican-share-declined-u-s-unauthorized-immigrant-population-fell-in-2015-below-recession-level/>

⁴⁸<http://www.pewresearch.org/fact-tank/2017/04/25/as-mexican-share-declined-u-s-unauthorized-immigrant-population-fell-in-2015-below-recession-level/>

& Canada to Canada.) This would lead to the following shares of legals: Canada: 0.9%; Western Europe: 6.8%; Eastern Europe: 5.1%; Middle East: 4.12%; North Africa: 0%. See the excel spreadsheet for the exact calculations.

Religion of Immigrants

Data on legal immigrants' religions are taken directly from a report by the Pew Research Center (2013).⁴⁹

Unemployment

Unemployment rate for total immigrants: 5.5% (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)

Unemployment rate for legal immigrants: 5.5%, computed as:

$$\frac{\text{Number of immigrants unemployed} - \text{Number of illegals unemployed}}{\text{Number of immigrants in labor force} - \text{Number of illegals in labor force}}$$

- Number of immigrants unemployed in 2015 = 1,495,466 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegal immigrants unemployed in 2015 = 423,124 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)
- Number of immigrants in the labor force in 2015 = 27,184,775 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegal immigrants in the labor force in 2015 = 7,721,686 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)

Using the alternative estimate of illegals unemployed from the Migration Policy Institute (2014) and estimates of unemployed immigrants from the Pew Research Center (2014), we obtain unemployment rate = 5% for 2014.

Poverty

Poverty rate for total immigrants: 16.3% (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)

Poverty rate for legal immigrants: 13.6%, computed as:

$$\frac{\text{Number of immigrants below the poverty threshold} - \text{Number of illegals below the poverty threshold}}{\text{Number of immigrants in the U.S.} - \text{Number of illegals in the U.S.}}$$

- Number of immigrants below the poverty threshold = 7,045,815 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegals below the poverty threshold = 2,673,947 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)
- Number of immigrants in the U.S.= 43,158,110 (Source: Pew Research Center (2017). Characteristics of the U.S. foreign-born population: 2015)
- Number of illegals in the U.S.= 11,042,503 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)

⁴⁹<http://www.pewforum.org/2013/05/17/the-religious-affiliation-of-us-immigrants/>

Using the alternative estimate of illegals below the poverty threshold from the Migration Policy Institute (2014) and estimates of poor immigrants from the Pew Research Center (2014), we obtain poverty rate = 12.3% for 2014.

Education

Share of low educated total immigrants: 27.6% (Source: CPS 2015)

Share of low educated legal immigrants: 22.0%, computed as

$$\frac{\text{Number of immigrants who have not completed high school} - \text{Number of illegals who have not completed high school}}{\text{Number of immigrants 18 and older in the U.S.} - \text{Number of illegals 18 and older in the U.S.}}$$

- Number of immigrants who have not completed high school = 10,961 (Source: CPS 2015)
- Number of illegals who have not completed high school = 4,414 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)
- Number of immigrants 18 and older in the U.S. = 39,681 (Source: CPS 2015)
- Number of illegals 18 and older = 9,978,611 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)

Using the alternative estimate for illegals 25 and older from the Migration Policy Institute (2014) and for immigrants 25 and older from the CPS 2014, we obtain share of low educated = 20.9%.

Share of high educated total immigrants: 35.9% (Source: CPS 2015)

Share of high educated legal immigrants: 41.4%, computed as

$$\frac{\text{Number of immigrants who have at least a 2-year degree} - \text{Number of illegals who have at least a 2-year degree}}{\text{Number of immigrants 18 and older in the U.S.} - \text{Number of illegals 18 and older in the U.S.}}$$

- Number of immigrants who have at least a 2-year degree = 13,075 (Source: CPS 2015)
- Number of illegals who have at least a 2-year degree = 1,955,770,⁵⁰ (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)
- Number of immigrants 18 and older in the U.S. = 39,681 (Source: CPS 2015)
- Number of illegals 18 and older = 9,978,611 (Source: Center for Migration Studies. State-Level Unauthorized Population and Eligible-to-Naturalize Estimates 2015)

Using the alternative estimate for illegals 25 and older from the Migration Policy Institute (2014) and for immigrants 25 and older from the CPS 2014, we obtain share of high educated = 42.8%.

Relative Transfers

The statistics we report are from Liebig and Mo (2013),⁵¹ who use data from the CPS March Supplement 2007-09, and refer to total immigrants. It is likely that this number is mostly representative of legal immigrants because illegal immigrants are not eligible for or less likely to claim many public benefits. See, for instance, *Econofact* “Do Undocumented Immigrants Overuse Government Benefits?” March 28, 2017.⁵²

⁵⁰The Center for Migration Studies reports joint estimates of illegals with some college or a 2-year degree. To obtain the number of illegals with a 2-year degree we assume that the splitting between some college and 2-year degree is proportional to the splitting in the total immigrant population in the CPS. If, instead, we assume that no illegal in the joint category has a 2-year degree, the number of high educated illegals would be 1,467,157, and the share of high educated among legal immigrants would be 43%.

⁵¹Liebig, T. and J. Mo (2013). The Fiscal Impact of Immigration in OECD Countries, Chapter 3. In OECD International Migration Outlook 2013. OECD Publishing, Paris.

⁵²Available at <https://econofact.org/do-undocumented-immigrants-overuse-government-benefits>.

A-2.2.2 European countries

Number and Origins of Immigrants

Data on the number of immigrants is from the UN (Trends in International Migrant Stock: the 2017 Revision) for all countries. Data on the origins of immigrants also comes from the UN (Trends in International Migrant Stock: the 2017 Revision) for Italy, France, the U.K., and Germany. Data on origins for Sweden is from the OECD (International Migration Database, 2015). Both the UN and the OECD use national censuses as their original sources. For each country, we report here some information on the way these censuses are conducted and on the population they reach. In Italy, Sweden, Switzerland, and Finland, censuses only cover legal immigrants. In the U.K., France and Germany, censuses cover both legal and illegal immigrants. However, *i*) illegal immigrants are likely to be severely underrepresented in the census, because they typically have very low response rates to official surveys; *ii*) estimates of the number of illegal immigrants suggest that these make up, on average, only around 0.5% of the population in these countries. Thus, none of our statistics would be affected in a non-negligible way if we tried to impute statistics for legal immigrants only for the U.K, France, and Germany. We thus use the UN and OECD data without further corrections.

Italy: 2011 Census. They only survey regular (legal) immigrants, that is, those who have a legal permit to stay in the country.⁵³

Sweden: 2011 Census. The census is based on the population register, which takes data from the Swedish Tax Agency.⁵⁴ In Sweden only legal immigrants pay taxes.⁵⁵

Germany: The 2011 Census is based on official registers and complemented by surveys. In Germany, illegal immigrants were estimated to be between 180,000 and 520,000 (less than 0.5% of the total population) as of 2014.⁵⁶

UK: 2011 Census. Respondents are not asked about their legal status.⁵⁷ According to the most recent estimate, illegal immigrants were 533,000 in 2007, around 0.8% of the total population.⁵⁸

France: 2011 Census. Respondents are not asked about their legal status, but, as in the U.K., illegal immigrants have very low response rates and are thus unlikely to be represented in that data. According to recent estimates from the Ministry of the Interior, in France there are about 300,000 illegal immigrants, making up around 0.5% of the total population.⁵⁹

Finland: 2011 Census. The census is based on official registries. Only people with a valid residence permit (legal) may be registered in the Population Register.⁶⁰

Switzerland: 2011 Census. The variable related to country of birth in the census is based on official residents' registers, which do not include illegal immigrants. Thus, all statistics are based on legal immigrants only.⁶¹

Religion of Immigrants

⁶¹See Roberts, C., Lipps, O., & Kissau, K. (2013). Using the Swiss population register for research into survey methodology. FORS Working Paper Series, paper 2013-1. Lausanne: FORS.

Data are from the Pew Research Center, Global Religious Futures 2010, which is mostly based on national Censuses. The Pew Research Center has recently published a report on the inflow of Muslim immigrants in Europe between 2010 and 2016.⁶² According to the report, Sweden is the country that experienced the most significant inflow of Muslim immigrants, relatively to its 2010 immigrant population, in particular because of the large inflow of refugees from Middle East.⁶³ The report only focuses on recent immigrants.

Unemployment, Poverty, Education

Data are from the Eurostat Labor Force Survey 2016. The survey covers legal immigrants only.⁶⁴

Transfers to Immigrants

The statistics we report are from Liebigh and Mo (2013), who use data from the European Union Survey of Income and Labour Conditions (EU-SILC) 2007-09.

A-3 High Immigration Sectors

We define a sector as *High Immigration* if the share of immigrants working in that sector is higher than the average share of immigrants employed in the country. The sectors that we classify as *High Immigration* are listed here in English for each country. Sectors are described in greater detail and in each original language online at https://www.dropbox.com/s/rud1ii161d39yxx/sector_list.pdf?dl=0.

- U.S.: Farming, fishing, and forestry, Building and grounds cleaning and maintenance, Construction and extraction, Computer and mathematical occupations, Production occupations, Life, physical, and social science, Food preparation and serving related occupations, Occupations related to transportation and material moving, Occupations related to personal care, childcare and leisure, and Healthcare support occupations. Source: CPS 2016.
- U.K.: Domestic personnel; Accommodation and food services; Transport and storage; Information and communication; Administrative and support service activities; Manufacturing; Professional, scientific and technical activities; Health and social work; Financial and insurance activities. Source: Annual Population Survey, April 2016 - March 2017 (<https://discover.ukdataservice.ac.uk/catalogue?sn=8197>). Sector breakdown criteria: SIC 2007.
- France: Non qualified artisanal workers; Domestic personnel; Merchants and retailer workers; Qualified artisanal workers; Craftsmen; Agricultural workers; Non qualified industrial workers; Police and military; Information, arts and entertainment; Drivers; Teachers and scientific occupations; Industrial workers. Source: INSEE (Enquete Emploi en continu 2016). Sector breakdown criteria: CSE two digits sectors.
- Italy: Street and related sales and service workers; Personal care workers; Cleaners and helpers; Food preparation assistants; Agricultural, forestry and fishery laborers; Laborers in mining, construction, manufacturing and transport; Building and related trades workers, excluding electricians; Refuse workers and other elementary workers; Personal service workers; Food processing, wood working, garment and other craft and related trades workers; Market-oriented skilled forestry, fishery and hunting workers; Stationary plant and machine operators; Metal, machinery and related trades workers; Assemblers;

⁶²Pew Research Center (2017). Europe's Growing Muslim Population, available at <http://www.pewforum.org/2017/11/29/europes-growing-muslim-population/>

⁶³However, there is some uncertainty around the number of Muslim immigrants in Sweden. The Pew Research Center reports that about 300,000 Muslim immigrants moved to Sweden between 2010 and 2016, while the Swedish government claims that in 2017 "The Muslim faith communities have approximately 140 000 members" (See <https://www.government.se/articles/2017/02/facts-about-migration-and-crime-in-sweden/>).

- Germany: Transport, logistics, protection and security; Commodity production and manufacturing; Commercial services, trade, sales, hotels and tourism; Construction, architecture, surveying and mapping, and facility technology. Source: Destatis (Mikrozensus 2015).
- Sweden: Hotel and restaurant; Transport; Healthcare and care; Education; Business and financial operations. Source: Statistics Sweden (Sysselsatta efter näringsgren 2006-2015, Table 3).

A-4 Charities Listed for the Donation Question

We report here the charities we listed in the donation question in each country. See Q32 in Appendix A-6 for the exact wording of the question.

- **U.S.:** Feeding America, The Salvation Army
- **U.K.:** Save the Children U.K., The Salvation Army
- **France:** Les restos du cœur, Emmaüs
- **Germany:** SOS Kinderdorf, Tafel
- **Italy:** Caritas, Save the Children Italia
- **Sweden:** Frälsningsarmén, Majblomman

A-6 Full U.S. Questionnaire in English

Answer options are in *italic*, separated by a semicolon.

1. See Figure A-1

Yes, I would like to take part in this study, and confirm that I WAS BORN IN THE U.S. and I am 18 or older; No, I would not like to participate

2. Were you born in the United States?

Yes; No

FIGURE A-1: FIRST PAGE OF THE SURVEY (ENGLISH VERSION)

We are a non-partisan group of academic researchers from the Faculty of Arts and Sciences at Harvard University. Our goal is to understand how information we see and hear in the media influences views on policies. No matter what your political views are, this is an important matter, and by completing this survey, you are contributing to our knowledge as a society. You might not agree with all the information presented, and that is perfectly fine. If you do not feel comfortable with a question you can skip it. Our survey will give you an opportunity to express your own views.

Please note that it is very important for the success of our research that you **answer honestly** and **read the questions very carefully** before answering. Any time you don't know an answer, just give your best guess. However, please be sure to spend enough time reading and understanding the question. To ensure the quality of survey data, your responses will be subject to sophisticated statistical control methods, which can detect incoherent or rushed answers. **Responding without adequate effort or skipping many questions may result in your responses being flagged for low quality and you may not receive your payment.**

It is also very important for the success of our research project that you **complete the entire survey**, once you have started. This survey should take (on average) about 20 minutes to complete. If you complete the entire survey, you will be invited to take another voluntary paid follow up survey a week from now, if you wish.

Notes: Your participation in this study is purely voluntary. Your name will never be recorded by researchers. Results may include summary data, but you will never be identified. The data will be stored on Harvard servers and will be kept confidential. The collected anonymous data may be made available to other researchers for replication purposes. Please print or make a screen-shoot of this page for your records. If you have any question about this study, you may contact us at socialsciencestudies@gmail.com. For any question about your rights as a research participant you may contact cuhs@harvard.edu.

3. What is your gender?

Male; Female

4. What is your age?

5. What was your TOTAL household income, before taxes, last year? \$0-\$9999; \$10000-\$14999; \$15000-\$19999; \$20000-\$29999; \$30000-\$39999 ; \$40000-\$49999 ; \$50000-\$69999; \$70000-\$89999; \$90000-\$109999; \$110000-\$149999; \$150000-\$199999 : \$200000+

6. Please indicate your marital status.

Single; Married; Legally separated or divorced; Widowed

7. How many children do you have?

I do not have children: 1; 2; 3; 4; 5 or more

FIGURE A-2: QUESTION ON PREFERRED INCOME TAX RATES FOR VARIOUS INCOME GROUPS

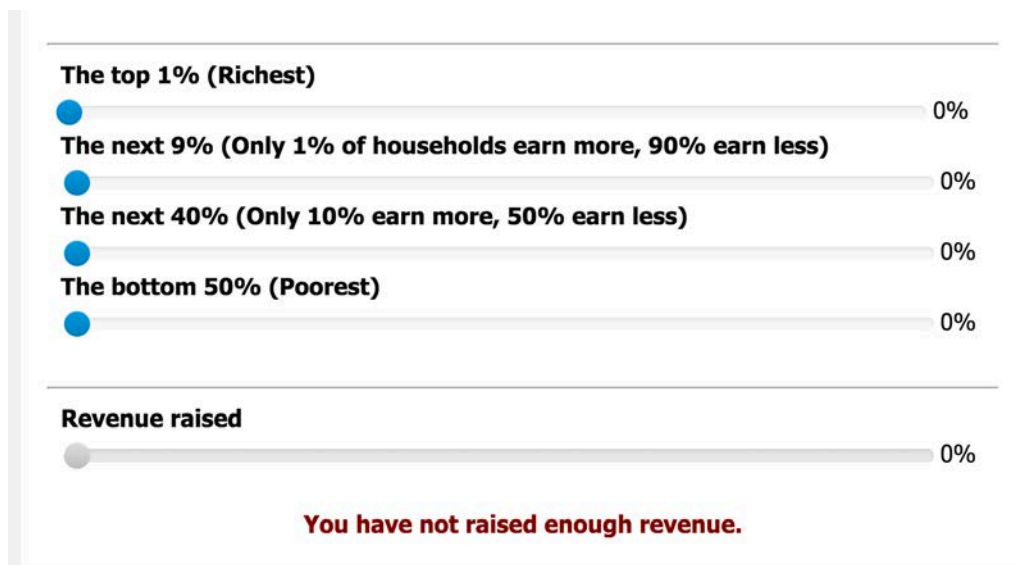

The government currently raises a certain amount of revenue through the income tax in order to sustain the current level of public spending. In your view, what would be the fair split of the tax burden to sustain public spending?

The income tax* rate is the percentage of your income that you pay in federal income tax. For example, if you earn \$30,000 and you pay \$3,000 in income taxes, your income tax rate is 10%.

Please use the sliders below to tell us how much you think each of the following groups should pay as a percentage of their total income.

While you adjust the four sliders for each group, the fifth bar at the bottom moves in order to show you how much of the current revenue you have been able to raise so far. The bar appears red as long as you have not raised enough revenue, or if you have raised more money than what is needed.

You will only be able to move to the next question when you meet the revenue target and the bar becomes green.

8. How would you describe your ethnicity/race?

European American/White; African American/Black; Hispanic/Latino; Asian/Asian American; Other

9. Were both of your parents born in the United States?

Yes; No

10. [If Yes to Q9] Where was your father born?

[dropdown menu with list of countries]

FIGURE A-3: QUESTION ON PREFERRED ALLOCATION OF GOVERNMENT BUDGET

- 1) **Defense and National Security**, which refers to the costs of the Defense department and the costs of supporting security operations in the U.S. and in foreign countries.
- 2) **Public Infrastructure**, which includes, among others, transport infrastructure like roads, bridges and airports, and water infrastructure.
- 3) **Spending on Schooling and Higher Education**, including help for children from low income families to attend school and university.
- 4) **Social Security, Medicare, Disability Insurance and Supplemental Security Income (SSI)**, which provide income support and help with health care expenses to the elderly and the disabled.
- 5) **Social Insurance and Income Support Programs**. This covers help to the unemployed (through unemployment insurance) and help for low income families (such as through Food stamps or the earned income tax credit (EITC), a tax credit for low-income working families)
- 6) **Public Spending on Health**, such as Medicaid for the poor (a healthcare program for low income families) or tax subsidies to help families buy health insurance.
- 7) **Affordable Housing**. This includes subsidies to make housing more affordable for low income families and funds to build and manage public housing.

Please enter the percent of the budget you would assign to each spending category (the total must sum to 100):

Defense and National Security	<input type="text"/>
Public Infrastructure	<input type="text"/>
Spending on Schooling and Higher Education	<input type="text"/>
Social Security, Medicare, Disability Insurance and Supplemental Security Income (SSI)	<input type="text"/>
Social Insurance and Income Support Programs	<input type="text"/>
Public Spending on Health	<input type="text"/>
Affordable Housing	<input type="text"/>
Total	<input type="text" value="0"/>

11. *[If Yes to Q9]* Where was your mother born?
[dropdown menu with list of countries]

12. What is your ZIP code?

13. Which category best describes your highest level of education?

Eighth Grade or less; Some High School; High School degree / GED; Some College; 2-year College Degree; 4-year College Degree; Master's Degree; Doctoral Degree; Professional Degree (JD, MD, MBA)

14. What is your current employment status?

Full-time employee; Part-time employee; Self-employed or small business owner; Unemployed and looking for work; Student; Not currently working and not looking for work; Retiree

15. *[If Full-time employee; Part-time employee; Self-employed or small business owner]* Are you employed in one of the following sectors? Check the one that applies. If you have multiple jobs, check the one that describes your main occupation.

[See Appendix A-1]

16. *[If Unemployed and looking for work; Not currently working and not looking for work; Retiree]* Even if you are not currently working, what sector did your latest occupation fall under? Check the one that applies. If you have had multiple jobs, check the one that describes your main occupation.

[See Appendix A-1]

17. On economic policy matters, where do you see yourself on the liberal/conservative spectrum?

Very liberal; Liberal; Moderate; Conservative; Very conservative

18. In politics, as of today, do you consider yourself a Republican, a Democrat or an independent?

Republican; Democrat; Independent

19. Did you vote in the last presidential election?

Yes; No

20. *[If Yes to Q19]* In the last presidential election, you supported:

Hillary Clinton; Donald Trump; Jill Stein; Gary Johnson

21. *[If No to Q19]* Even if you did NOT vote, please indicate the candidate that you were most likely to have voted for or who represents your views most closely

Hillary Clinton; Donald Trump; Jill Stein; Gary Johnson

22. Before proceeding to the next set of questions, we want to ask for your feedback about the responses you provided so far. It is vital to our study that we only include responses from people who devoted their full attention to this study. This will not affect in any way the payment you will receive for taking this survey. In your honest opinion, should we use your responses, or should we discard your responses since you did not devote your full attention to the questions so far?

Yes, I have devoted full attention to the questions so far and I think you should use my responses for your study; No, I have not devoted full attention to the questions so far and I think you should not use my responses for your study

In the next two questions, we ask you to think about the total level of funds that the government raises and spends today on various policies. For the purpose of these questions, suppose that the level of government spending is fixed at its current level and cannot be changed. We will ask about your views on two aspects: a. First, on the fair split of the tax burden to raise these funds; b. Second, on how you think the government should spend these funds.

23. See Figure A-2

24. See Figure A-3

25. Do you think income differences between rich and poor people are:
Not a problem at all; A small problem; A problem; A serious problem; A very serious problem
26. To reduce income differences between rich and poor people, the government (at the local, state, or federal level) has the ability and the tools to do:
Nothing at all; Not much; Some; A lot
27. Some people think that the government (at the local, state, or federal level) should not care about income differences between rich and poor people. Others think that the government should do everything in its power to reduce income inequality. Rate on a scale of 1 to 7 on how you feel about this issue, with 1 being the government should not concern itself with income inequality and 7 being the government should do everything in its power to reduce income inequality.
- Here are several things that the local, state, or federal government might do to reduce income differences between rich and poor people. Please indicate if you favor or oppose them. Keep in mind that, in order to finance an expansion of any of these, other types of spending (like spending on infrastructure and defense, for example) would have to be scaled down or taxes would have to be raised.
28. Would you say that you strongly favor, favor, neither favor nor oppose, oppose or strongly oppose spending more money on schools in poor neighborhoods?
Strongly favor; favor; neither favor nor oppose; oppose; strongly oppose
29. Would you say that you strongly favor, favor, neither favor nor oppose, oppose strongly oppose spending more money to provide decent housing for those who cannot afford it?
Strongly favor; favor; neither favor nor oppose; oppose; strongly oppose
30. Would you say that you strongly favor, favor, neither favor nor oppose, oppose or strongly oppose increasing income support programs for the poor?
Strongly favor; favor; neither favor nor oppose; oppose; strongly oppose
31. How much of the time do you think you can trust our federal government to do what is right?
Almost always; A lot of the time; Not very often; Almost never
32. By taking this survey, you are automatically enrolled in a lottery to win \$1000. In a few days you will know whether you won the \$1000. The payment will be made to you in the same way as your regular survey pay, so no further action is required on your part. In case you won, would you be willing to donate part or all of your \$1000 gain for a good cause? Below you will find 2 charities which help people in the U.S. deal with the hurdles of everyday life. You can enter how many dollars out of your \$1000 gain you would like to donate to each of them. If you are one of the lottery winners, you will be paid, in addition to your regular survey pay, \$1000 minus the amount you donated to charity. We will directly pay your desired donation amount to the charity or charities of your choosing. Enter how much of your \$1000 gain you'd like to donate to each charity:
Feeding America: ... ; The Salvation Army: ...
- In what follows, we refer to immigrants as people who were not born in the U.S. and legally moved here at a certain point of their life. We are NOT considering illegal immigrants.
33. See Figure 4
34. The map here shows you the main regions of the world. The pie chart below represents all legal IMMIGRANTS currently living in the U.S.. Where do you think these immigrants come from? Move the sliders to indicate how many out of every 100 immigrants come from each region, in your opinion. As you move the sliders, the pie chart will adjust to show your responses, reflecting the colors of the various regions, as in the map. (Your responses must add up to 100)
[See Figure 5]

35. Think again about all of the legal immigrants currently living in the U.S.. What do you think is their religion? Fill in the boxes below to indicate how many out of every 100 immigrants you think practice each religion.

Christianity ...; Islam ...; Buddhism ...; Hinduism ...; Other Religions/Atheist ...

36. Out of every 100 people born in the U.S. how many are currently unemployed? By unemployed we mean people who are currently not working but searching for a job (and maybe unable to find one).

Now let's compare this to the number of unemployed among legal immigrants. Out of every 100 legal immigrants how many do you think are currently unemployed?

37. Out of every 100 people born in the U.S., how many have at least a two-year college degree?

Now let's compare this to the number of college-educated legal immigrants. Out of every 100 immigrants in the U.S. today how many do you think have at least a two-year college degree?

38. Out of every 100 people born in the U.S., how many have not completed high school?

Out of every 100 legal immigrants in the U.S. today how many do you think have not completed high school?

39. Out of every 100 people born in the U.S., how many live below the poverty line? The poverty line is the estimated minimum level of income needed to secure the necessities of life.

Let's compare this to poverty among legal immigrants. Out of every 100 legal immigrants in the U.S. today, how many do you think live below the poverty line?

40. Some people think that the government (at the local, state, or federal level) should only support people who were born in the U.S.. Others think that the government should care equally about all the people living in the country, regardless of their country of origin and regardless of whether they are born in the U.S.. Rate on a scale of 1 to 7 on how you feel about this issue, with 1 being the government should focus on supporting people born in the U.S. and 7 being the government should care equally about everyone.

41. What is your view on the number of legal immigrants from foreign countries who are permitted to come to the United States to live? Pick the answer that best reflects your view.

The excessive number of legal immigrants today is a very big problem. We should ask many legal immigrants to leave the country and we should stop accepting new immigrants; The number of legal immigrants today is a big problem and we should decrease by a lot the number permitted to come to the U.S. in the future; The number of legal immigrants today is somewhat of a problem and we should try and decrease a bit the number permitted to come in; The number of legal immigrants today is not a problem. We should keep letting in the same number of immigrants each year as until now; The number of legal immigrants today is not a problem at all. We should let even more legal immigrants come live in the U.S. and increase the number that is permitted to come every year

42. In your view, how soon after arriving should immigrants be entitled to government assistance such as Medicaid, food stamps, or welfare on the same basis as citizens?

Immediately, as soon as they arrive; 1 year after; 3 years after; 5 or more years after; only after they receive citizenship; never

43. As you may know, once immigrants who come into the country receive U.S. citizenship, they are allowed to vote in all local, state, and federal elections. In your view, when should immigrants who come into the country legally be allowed to apply for U.S. citizenship?

2 years after arriving; 5 years after arriving; 10 years after arriving; 20 years after arriving; They should never be allowed to apply for citizenship

44. Suppose someone is not born in the United States but now lives here. At what point would you consider this person to be “American”?

Immediately, as soon as he arrives; After he has spent 5 years in the U.S.; After he has spent 10 years in the U.S.; It depends on where he comes from; As soon as he gets citizenship; I would never consider him to be American, but if his kids were born in the U.S. I would consider them truly American; I would not consider him or his kids to ever be truly American

45. Which has more to do with why an immigrant living in the U.S. is poor?

Lack of effort on his or her own part; Circumstances beyond his or her control

46. Which has more to do with why an immigrant living in the U.S. is rich?

Because she or he worked harder than others; Because she or he had more advantages than others

47. U.S. born residents receive government transfers in the form of public assistance, Medicaid, child credits, unemployment benefits, free school lunches, food stamps or housing subsidies when needed. How much do you think each legal immigrant receives on average from such government transfers? An average immigrant receives...

No transfers; One third as much as a U.S. born resident; Half as much as a U.S. born resident; As much as a U.S. born resident; Slightly more than a U.S. born resident; Twice as much as a U.S. born resident; Three times as much as a U.S. born resident; More than ten times as much as a U.S. born resident

48. Imagine two people, John and Mohammad, currently living in the U.S. with their families. John is born in the U.S., while Mohammad legally moved to the U.S. five years ago. They are both 35, have three children, and earn the same low income from their jobs. In your opinion, does Mohammad pay more, the same, or less in income taxes than John?

A lot more; More; same; less; a lot less

49. In your opinion does Mohammad, who is an immigrant, receive more, the same, or less government transfers (such as e.g., public assistance, Medicaid, child credits, unemployment benefits during unemployment spells, free school lunches, food stamps or housing subsidies) than John?

A lot more; More; same; less; a lot less

50. Do you have any friends or acquaintances who were born outside the U.S.?

Yes; No

51. *[If Yes to Q50]* Where do they come from? (check all that apply)

Canada; Latin America; Western Europe; Eastern Europe; North Africa; Sub-Saharan Africa; Middle-East; Asia; Australia/New Zealand

A-7 Additional Information on the Surveys

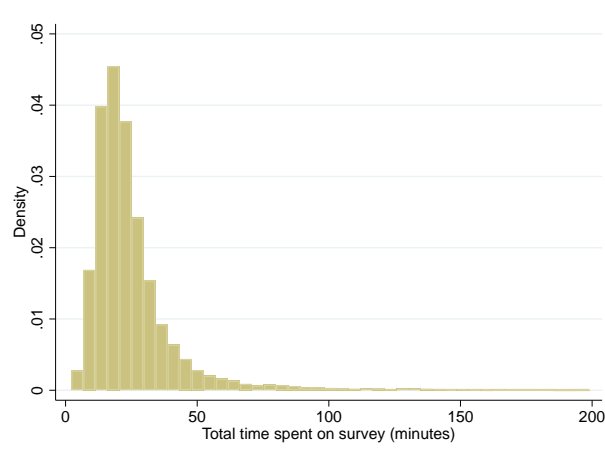

TABLE A-1: RANDOMIZATION GROUPS

	Treatment/Control	Saw redistribution block before/after immigration block
Group 1	Control	Before
Group 2	Control	After
Group 3	Treatment 1	Before
Group 4	Treatment 1	After
Group 5	Treatment 2	Before
Group 6	Treatment 2	After
Group 7	Treatment 3	Before
Group 8	Treatment 3	After

Notes: “Before” and “After” refer to whether the redistribution block was seen before or after the immigration block.

A-8 Additional Figures and Tables

FIGURE A-4: DISTRIBUTION OF TOTAL TIME SPENT ON THE SURVEY

Notes: The figure shows the distribution of the total time respondents across all countries spent on the survey (truncated at 200 minutes).

FIGURE A-5: MISPERCEPTION OF THE SHARE OF IMMIGRANTS: CONTROL VS. SHARE OF IMMIGRANTS TREATMENT GROUPS

(A) U.S.

(B) U.K.

FIGURE A-5: MISPERCEPTION OF THE SHARE OF IMMIGRANTS: (CONT.)

(C) FRANCE

(D) ITALY

FIGURE A-5: MISPERCEPTION OF THE SHARE OF IMMIGRANTS: (CONT.)

(E) GERMANY

(F) SWEDEN

Notes: The figure shows the distribution of the misperception of the share of immigrants of respondents in the control group (left panel) and in the “Share of Immigrants” treatment group (right panel), by country.

FIGURE A-6: SHARE OF RESPONDENTS WHO BELIEVE IMMIGRANTS RECEIVE AT LEAST TWICE AS MANY GOVERNMENT TRANSFERS AS NATIVES

Notes: The figure shows the share of respondents who think that an average immigrant receives at least twice as many government transfers as an average native. See the notes for Figure 11.

TABLE A-2: PERCEPTIONS BY COUNTRY

	U.S.			U.K.			France		
	Actual	Perceived		Actual	Perceived		Actual	Perceived	
		Mean	Median		Mean	Median		Mean	Median
	(1)	(Stand. Error)	[Interq. Range]	(4)	(Stand. Error)	[Interq. Range]	(7)	(Stand. Error)	[Interq. Range]
	(2)	(3)	(5)	(6)	(8)	(9)			
Panel A: Perceptions									
Share of Immigrants	10.00	36.08 (0.73)	31.00 [20.00, 48.00]	13.40	31.39 (0.64)	30.00 [15.00, 42.00]	12.20	28.81 (0.61)	25.00 [14.00, 40.00]
Share Immigrants from North Africa	0.30	8.43 (0.23)	7.00 [4.00, 11.00]	0.90	9.88 (0.27)	10.00 [5.00, 14.00]	35.30	27.21 (0.50)	25.00 [18.00, 35.00]
Share of Immigrants from Middle East	4.10	12.20 (0.32)	10.00 [5.00, 16.00]	5.10	10.84 (0.34)	9.00 [5.00, 15.00]	5.60	10.98 (0.34)	9.00 [4.00, 15.00]
Share of Immigrants from Western Europe	7.70	10.88 (0.27)	10.00 [5.00, 15.00]	19.00	16.22 (0.43)	13.00 [7.00, 21.00]	29.30	10.94 (0.33)	10.00 [4.00, 15.00]
Share of Immigrants from Eastern Europe	6.10	9.88 (0.23)	10.00 [5.00, 13.00]	20.00	23.51 (0.47)	20.00 [14.00, 30.00]	5.20	14.53 (0.34)	13.00 [8.00, 20.00]
Share of Immigrants from North America	2.30	9.69 (0.33)	7.00 [4.00, 11.00]	2.30	6.10 (0.22)	5.00 [2.00, 9.00]	1.00	5.97 (0.31)	3.00 [1.00, 7.00]
Share of Immigrants from Latin America	42.30	24.42 (0.55)	20.00 [12.00, 32.00]	3.90	5.61 (0.19)	5.00 [2.00, 8.00]	3.40	5.69 (0.20)	4.00 [2.00, 8.00]
Share of Muslim Immigrants	10.00	22.69 (0.50)	20.00 [10.00, 30.00]	23.00	33.89 (0.68)	30.00 [20.00, 45.00]	48.00	50.23 (0.72)	50.00 [30.00, 65.00]

Observations		971			973			481	

Notes: Panel A reports mean and median perceptions for each country. The standard errors of the means are in parentheses and the interquartile ranges (25th and 75th percentiles) are in square brackets. The actual value of the statistic for each country is reported in columns (1), (4), (7), (10), (13) and (16). Panel B reports the mean of each attitude variable for each country and its standard error (in parentheses).

All regressions include the same controls as those in Table 3. Standard errors in parentheses. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

A-9 Exposure to Immigrants

In Panel A of Figure A-7, we plot the coefficients on a dummy for “Knowing an immigrant” in regressions of the form:

$$Y_i = \alpha + \beta \text{Knowing an Immigrant} + \gamma \mathbb{X}_i + \varepsilon_i$$

where Y_i is each variables listed on the y axis and \mathbb{X} are all individual level controls (income, education, political affiliation, etc.) including country fixed effects. The regression is performed on the control group and all variables Y_i are turned into z-scores so as to make the coefficients directly comparable.

Knowing an immigrant is significantly and strongly correlated with lower misperceptions across all dimensions, even after controlling for the full set of individual characteristics. Respondents who know an immigrant overestimate by less the total share of immigrants, the share of Muslim immigrants, the share of low-educated, unemployed, and poor immigrants. They underestimate by less the share of Christian immigrants and the share of highly educated immigrants. They are much less likely to think that immigrants are poor because of lack of effort and much more likely to think that they are rich because of their own effort. Finally, they are significantly less likely to believe that the average immigrant receives more transfers than the average native and that Mohammad gets more transfers (than John) on net.

Panel B of Figure A-7 plots the coefficients on a dummy for “Knowing an immigrant” in regressions of the form:

$$Y_i = \alpha + \beta \text{Knowing an Immigrant} + \gamma \mathbb{X}_i + \varepsilon_i$$

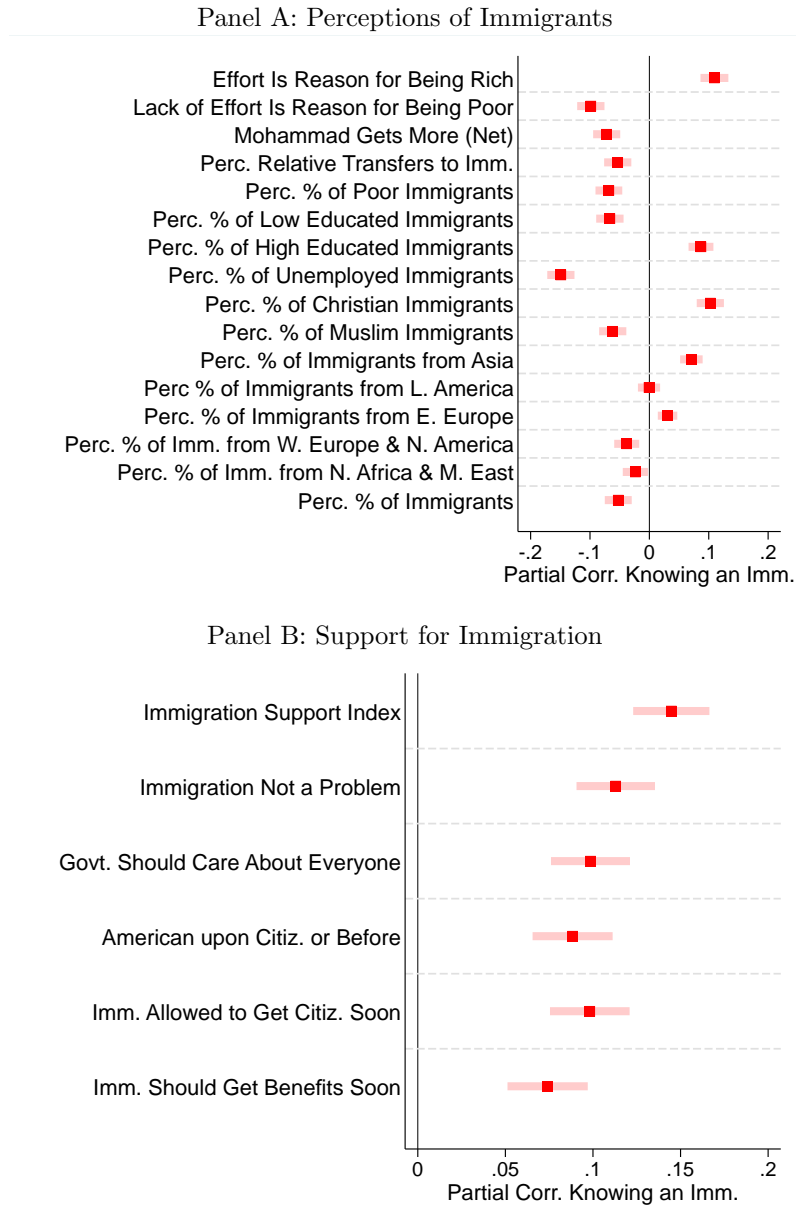

where Y_i is each variables listed on the y axis and \mathbb{X} are all individual level controls (income, education, political affiliation, etc.) including country fixed effects. Again, the regression is performed on the control group only and all variables are z-scores so as to make the coefficients directly comparable. Knowing an immigrant is significantly correlated with support for immigration overall, as well as according to each separate dimension.

Notes: The table reports the effect of the order treatment and the three informational treatments on the variables entering the Redistribution support index. Outcome variables are defined in Appendix A-1. All regressions include the same controls as those in Table 3. Standard errors in parentheses. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

FIGURE A-7: CORRELATION OF KNOWING AN IMMIGRANT WITH PERCEPTIONS OF IMMIGRANTS AND SUPPORT FOR IMMIGRATION

Notes: Panel A shows the coefficients β from $Y_i = \alpha + \beta \text{Knowing an Immigrant} + \gamma \mathbb{X}_i + \varepsilon_i$ where Y_i is the z-score of each variable listed on the y axis and \mathbb{X} are all individual level controls (income, education, political affiliation, etc.) including country fixed effects. Variables Y_i are standardized z-scores and include the following misperceptions (from bottom to the top): share of immigrants, share of immigrants from North Africa and Middle East, share of immigrants from Western Europe and North America, share of immigrants from Eastern Europe, share of immigrants from Latin America, share of immigrants from Asia, share of Muslim immigrants, share of Christian immigrants, share of unemployed immigrants, share of high educated immigrants, share of low educated immigrants, share of poor immigrants, average transfers received by immigrants relative to natives. *Mohammad Gets More (Net)*, *Lack of Effort is Reason for Being Poor*, *Effort is Reason for Being Rich* are dummies equal to 1, respectively, if the respondent believes that Mohammad gets more transfers on net than John, immigrants are poor because of lack of effort, immigrants are rich thanks to their own effort. Panel B shows the coefficients of similar regressions where the dependent variables, on the y-axis, are as defined in the notes for Figure 15 and 17. Shaded areas are 90% confidence intervals.

A-10 Effort vs. Luck in Germany

To get a sense of the general attitudes towards the importance of luck versus hard work in Germany we look at the following question from the 2014 wave of the German General Social Survey (ALLBUS/GGSS):

What is the best way to get to the top in our society? Using the card, please rate the importance of the qualities and situations. Please tell me for each one how important you think it is for getting ahead in our society today. [Unimportant, Less Important, Important, Very important].

Figure A-8 reports the share of respondents thinking that the factor listed on the y-axis is important or very important to make it to the top. Some of these factors (Luck, Corruption, Opportunism, Right Social Background, Connections, Talent) are mostly related to luck/advantages, others (Industriousness, Initiative, Education) are more closely linked to hard work.

FIGURE A-8: WHAT FACTORS ARE IMPORTANT TO MAKE IT TO THE TOP?

Notes: The figure reports the share of German respondents who think that the factor listed on the y-axis is important or very important to make it to the top. Source: German General Social Survey (ALLBUS/GGSS) 2014. See Section A-10 for details.

A-11 Re-weighted sample

In our sample college-educated and unemployed are slightly over-represented compared to the population of our countries. As a robustness check, we compute weights to match the unemployment rate and the share of college educated in the countries of our sample. In order to keep our sample balanced along gender, age, and income, we also target these variables in constructing the weights.⁶⁵

In this section we report mean perceptions by country and treatment effects estimated on the re-weighted sample. Re-weighting observations do not affect significantly our estimates.

⁶⁵Hence, for each country, we split the sample into 160 cells based on gender (2) \times age (5) \times income (4) \times unemployed (2) \times college (2), and we compute a weight for each cell.

TABLE A-10: PERCEPTIONS BY COUNTRY – RE-WEIGHTED SAMPLE

	U.S.			U.K.			France		
	Actual	Perceived		Actual	Perceived		Actual	Perceived	
		Mean	Median		Mean	Median		Mean	Median
	(1)	(Stand. Error)	[Interq. Range]	(4)	(Stand. Error)	[Interq. Range]	(7)	(Stand. Error)	[Interq. Range]
	(2)	(3)	(5)	(6)	(8)	(9)			
Panel A: Perceptions									
Share of Immigrants	10.00	36.20 (0.75)	31.00 [20.00, 48.00]	13.40	31.62 (0.64)	30.00 [15.00, 43.00]	12.20	29.62 (0.67)	29.00 [15.00, 40.00]

A-12 Selection in the Follow-up

TABLE A-13: ABILITY OF COVARIATES TO PREDICT PARTICIPATION IN THE FOLLOW-UP SURVEY

	Has taken the Followup	
	Coefficient	P-value
Voted right	-0.005	0.712
Voted left	0.005	0.712
Male	-0.126	0.000
Young	-0.132	0.000
Immigrant parent	-0.043	0.077
College degree	0.009	0.504
Rich	-0.122	0.000
High immigration sector	-0.020	0.161

Notes: The table shows the coefficients and p-values from a series of regressions of the form $y_{ic} = \alpha + \beta Covariate_i + \epsilon_{ic}$, where $Covariate_i$ is the variable listed in the row. y_{ic} is a dummy equal to one if the respondent took the follow-up.
